It takes only 8 weeks to get a big job

Read what these men are doing in the Auto and Tractor Business. Here is your big chance to get "on easy street." Come to these great shops on the biggest FREE offer ever made.

O. H. Justus owns a big agency and repair shop at Parkersburg, W. Va. He says "that my schools give motor secrets that will put any man 'on easy street."

Emanuel Roshfeldt, Alberta, says; "Earning \$10 a day and only 20 years old,"

W. W. Peace gets \$250 a month and expenses operating a tractor in the oil fields.

Louis Beimer at 24 was made forcman over men many years older. That's not luck--it's Rake training.

Big Firms Need Trained Men

The Auto and Tractor Business is on the boom. Thousands of trained men will be needed during the next few months. I get calls every day from Garages, Battery Stations, Auto Repair, Welding Shops and other successful concerns for Rabe men. When the big fellows need high grade men they know where to come for them. They want Rabe trained men.

My Training Unusual

Scientific tool training—that's the secret. You do things here according to the latest engineering standards. Thousands of dollars have been spent in modern tools and equipment. That's why my men are at home in the biggest shops in the country. If you want to succeed the way Beimer and Justus and the rest have—qualify by the same method.

I'll Pay Your Railroad Fare

In order to fill the openings that now exist, I am making an offer no one has ever made before—**Free railroad fare, Free board.** But even that is not all. I'll tell you about the rest in my letter.

Send for FREE Book

My big illustrated training book tells how others are succeeding. It tells many things you ought to know about Autos and Tractors. Write for it and my **short time** offer NOW. It soon expires.

Rahe Auto & Schools

ls Your English a Handicap? This Test Will Tell You

HOUSANDS of people make little mistakes in their everyday English and don't know it. As a result of thousands of tests, Sherwin Cody found that the average person is only 61% efficient in the vital points of English. In a five-minute conversation, or in an average one-page letter, from five to fifty errors will appear. It is surprising how many experienced stenographers fail in spelling such common words as "business," "abbreviate," etc. It is astonishing how many business men use "who" for "whom," and mispronounce the simplest words. Few people know whether to use one or two "c's" or "m's" or "r's," whether to spell words with "ie" or "ci," and when to use commas in order to make their meaning absolutely clear. Make when to use commas in order to make their meaning absolutely clear. Make the test shown below, now. See where you stand on these 30 simple questions.

New Invention Improves Your English in 15 Minutes a Day

Mr. Cody has specialized in English for the past twenty years. His wonderful self-correcting device is simple, fascinating, time-saving, and incomparably efficient. You can write the answers to 50 questions in 15 minutes and correct your work in 5 minutes more. You waste no time in going over the things you know. Your efforts are automatically concentrated on the mistakes you are in the habit of making, and through constantly being shown the right way you soon acquire the correct habit in place of the incorrect habit. There is no tedious copying. There is no heart-breaking drudgery.

Answers

Between you and me I wish it would come Whom shall I call It's just as I sold How many are there-I should like to go The first two lessons He sat among the three The wind blows cold. You will find only one

"New Insides for Old Houses"

is one of the most valuable, and most appreciated, of all the forty-four books in the world-famous Cypress Pocket Library. And with good reason! It is volume 39 and contains 40 pages with 10 pictures, an Art Supplement in tint (showing the beauty of Cypress grain), Detailed Working Drawings on a sheet 24x36 inches, with Full Specifications for rebuilding the Hall, Library, Dining Room and Living Room with architectural correctness and artistic finish without resort to expensive hardwoods. (Cypress works easily and is wonderful under stains.) Each design is by an authority—on our special order. No "stock patterns." Write today for Vol. 39. We will send it promptly with our compliments. Study it. Your better acquaintance with Cypress, "the Wood Eternal," will be valuable to you in many ways in the future. It will save you tepair bills. "If you build of Cypress you build but once."

SOUTHERN CYPRESS MANUFACTURERS' ASSOCIATION

1219 Foydras Building, New Orleans, Louisiana or 1219 Graham Building, Jacksonville, Florida

Insist on TRADE - MARKED CYPRESS at your local lumber dealer's. If he hasn't it please advise us promptly and we will see that you are supplied.

Stop Wondering <u>How</u> I Teach Piano; I'll Show You, FREE

Yet when I first started giving piano and organ lessons by mail in 1891 my method was laughed at. Could my conservatory have grown as it has, obtained students in every state of the Union and in fact practically every civilized country of the world unless it produced very unusual and satisfying RESULTS for its students? See for yourself what it is that has brought my method so rapidly to the front. Write for free booklet and sample lessons.

Now, for the first time, you can obtain sample lessons without charge. In the past I have always been opposed to sending out free lessons, even to persons who were seriously interested in my course. But my friends have insisted that I give everybody a chance to see for themselves just how simple, interesting and DIFFERENT my lessons are, and I have consented to try the experiment for a short time. Simply mail the coupon below or write a postcard, and the 64-page booklet and sample lessons will go to you at once absolutely free and without obligation.

Within four lessons you will play an interesting piece on the piano or organ, not only in the original key, but in all other keys as well. Most students practice months before they acquire this ability. It is made possible by my patented invention the Colorotone. Another invention obtainable only from me is my hand-operated moving picture device, Quinn-dex. By means of Quinn-dex you actually see my fingers in motion on the piano, and can learn just how Conservatory, to train your own fingers.

Studio PM 50, 598 Columbia Road,

When I say that I can teach you piano in quarter the usual time, do not think that this is too good to be true. Modern inventions and improved methods have accomplished just as great wonders in other branches of education. You at least owe it to Nar yourself to investigate. Send coupon or postcard at once, before the offer of free sample lessons is

withdrawn.

.,.....

Boston 25, Mass.

Please send in c. without cost or obligation your free booklet, "How to Learn Pinto or Organ," free semple leasens, and full particulars of your method.

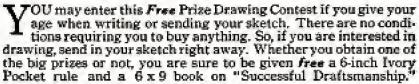

\$80 Drafting Course Free for best copy of sketch COUNTY OF THE PROPERTY OF T

\$25 Drawing Outfit Free

for next best copy of sketch

A Special Ivory Pocket Rule FREE!

for sending any copy of drawing shown at left hand side

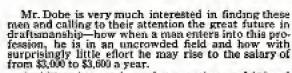

Chief Draftsman Dobe, of the Engineers' Equipment Company, offers these prizes to interest ambitious men who would like to better themselves at bigger salaries, doing work which brings big pay and at the same time leading more to advancement. There will be 72,000 open positions this year paying from \$3,000 to \$3,000 a year. The great building boom all over the country is causing this great demand, and industrial activity in the mechanical line makes it worth your while to give this opportunity your immediate attention.

Positions paying \$250 to \$300 per month, which ought to be filled by skilled draftsmen are vacant everywhere. There are in every part of this country ambitious men, who with practical training and personal assistance, will be qualified to fill these positions.

Copy this sketch

Ambitious boys and men, between the ages of 16 and 50, are wanted by great business concerns, and the man who is ready when opportunity calls him, gets the high grade positions and the highest pay.

No man can hope to share a part in the great coming prosperity in manufacturing and building, unless he is properly trained and able to do first class, practical work and is ready when he is called.

Mr. Dobe knows now is the time to get ready and he knows that few men realize this so well as he. So in order to interest men everywhere he is offering special prizes mentioned above.

If you send in what the judges decide to be the best drawing of the sketch above, you will be awarded a complete \$80 Practical Drafting Room Course, being trained by Mr. Dobe personally. This training is given by mail and he guarantees to train a limited number of students under this agreement to give practical drafting room training UNTIL placed in a permanent position at a salary of \$250 to \$300 per month.

To any student that Mr. Dobe accepts for his personal training, he will furnish a complete \$25 draftsman's working outfit absolutely free. This outfit consists of all instruments and tools required by any first class draftsman.

Considering that Mr. Dobe selects and limits the number of students for training, it is very important that you act promptly and send in your reply either with your sketch or without a sketch at once, asking for full particulars.

He will also send you a free book entitled "Successful Draftsmanship" in addition to all other information, telling you how you may learn drafting at home.

Mail Your Drawing At Once—

and Get Ivory Pocket Ruler
Absolutely FREE!

Ambitious men, interested in drafting, burry! Don't wait! This is your opportunity in this great profession. Accept this offer which Mr. Dobe makes. Send in your sketch or request for FREE Book and Ivory Pocket Rule. Address:

FREE - this \$25 Draftsman's Working Outfit

These are regular working instruments, the kind I use myself. I give them free to you if you enroll at once. Don't delay. Send for full information TODAY!

Chief Draftsman, Engineers' Equipment Co., 4001 Broadway, Div. 9357; Chicago, Ill.

BUILDING TRADES NEED TRAINED MEN!

Thousands of good positions at good salaries

HE business tide has turned! HE business tide has turned! And the building trades are leading the way back to prosperity! Government experts estimate that more than four billion dollars will be spent for construction this year,

"It will take us 12 years, working 25 per cent above normal," says John Ihlder, Manager of the Civic Development Department of the United States Chamber of Commerce, "to provide as adequately for our population as before the war."

Today the most vital need of this great building program is men-trained men-men who can step right in and do the skilled work that building construction requires.

There is a simple, easy, fascinating way by which you can prepare for a good position, at a good salary. You can do it right at home, in spare time, no matter where you live, through the International Correspondence Schools.

There is no question-no doubt about this. For thirty years the I. C. S. has been training men for advancement in the building trades and in many other business and technical subjects.

A recent investigation of 13,298 students enrolled in I. C. S. Building Trades Courses showed that 1291 had become Architects; 246 had become Designers; 494 had become Chief Draftsmen; 2827 had become Draftsmen; 1845 had become Contractors; 211 had become Assistant Foremen; 4030 had become Foremen; 2354 had become Superin-

In every instance these students reported salaries or independent incomes far greater than when they took up their studies. Many have shown increases of 300% to 500%. Some have incomes as high as \$25,000 per year.

You, too, can have the position you want in the work you like best, an income that will give you and your family the home, the comforts, the luxuries you would like them to have. No matter what your age, your present occupation, or your means, you can do it!

All we ask is the chance to prove it. That's fair, isn't it? Then mark and mail this coupon,

Clay_____State____

Earn Up to \$2500 per Month EXPENSES PAID

Many fine opportunities for trained Railway Traffic Inspectors. Steady, pleasant outdoor work; travel or remain near home.

Easy to Qualify

Prepare in three months' spare-time study at home. Position then guaranteed at not less than \$110 per month and expenses, with many chances for advancement thru contact with big railway officials.

SALARY WAS RAISED"

Rend what Mr. James M. Hurt, Jr., saps about the work:

"After finishing your course in Traffic inspection about three months ago, I was placed in a permanent position at \$110.00 per month. Several days ago my salary was masted to \$135.00 per month, and I have every reason to believe it will go higher soon if my work is satisfactory. Have rome to the conclusion that there are very few classes of work in which the uppertunities are as multiplied and or the same time, the work as pleasant as Traffic inspection."

You Take No Risk

If position is not obtained for you, entire enrollment fee is refunded without question. You have bothing to less.

Send coupon for details and booklet No. D-725

-At 27 Earns \$4,500 a Year

"Three years ago," writes A. J. Klick, "I was just an average young man of 24, possessing a fair education, liking a (so-called) good time, occupy-ing a bookkeeper's high stool and receiving \$1,100 a year.

"A crisis in my affairs woke me up and I began the serious study of Higher Accountancy.

"Before the year was over, I was making prog-ss financially. Interested in my work, adress financially. vancing steadily, more confident of myself, by the time I had finished the course, I had an executive position and \$3,000 a year.

"Last year I became comptroller of a good-sized corporation. My work became a pleasure; salary increased to \$3,800.

"This year I accepted a similar position with a larger corporation, with broader responsibilities and an initial salary of \$4,500. The future years are full of promise."

Unusual Opportunities in Accounting

Klick is right. His future years are full of promisel

Never in the history of business has the need for trained never in the instory of business has the need for trained accountants been so great or the rewards so attractive. The files of LaSalle Extension University contain literally thousands of letters reporting rapid advancement—incomes doubled, trebled and quadrupled as the result of a comparatively few months of home-study training. Where these men were getting \$1,500 or \$2,000 a short time ago, they are earning from \$3,000 to \$10,000 today, and they are on the ap grade.

Their chance is yours - if you will take it!

Train by the "Problem Method"

Why let the ather fellow walk away with the better job when the training you need is readily within your reach?

Right in your own home you can master Higher Accounting just as well as they! By the LaSalle Problem Method, you will be trained under the direct supervision of William B, Castenholz, A. M., C. P. A., termer Comptroller and Instructor, University of Illinois, assisted by a large staff of Certified Public Accountants, including members of the American Institute of Accountants. You will be guided step by step through every phase of modern accounting practice—Auditing, Cost Accounting, Business Law, Organization, Manage-

tient, Finance and Income Tax Procedure. You will handle practical accounting problems lifted bodily from husiness life, You will be given special preparation for the C. P. A. examinations.

Send for further information regarding the opportunities in accounting: read the enthusiastic testimony of men still in their twenties and early thirtnes who have broken away from the low-pay ranks and today are expert accountable—with in-comes ranging from 35,000 to \$10,000 a year. With this infor-mation we will send you particulars of our consenient-hay ment plan; also a copy of that inspiring book. "Ten Years' Pent-mation in One." "Get this book," said a prominent Chicago executive, "even if you have to pay five dollars for it." We will send it free.

It's a Crime to Slave for Low Pay

When It's So Easy To Earn Big Money

If You Are Making Small Pay, Then You Ought to Investigate This Simple Plan that Has Shown Thousands a Way to Magnificent Earnings

It is little short of an actual crime for a man to struggle along trying to make ends meet, when he can easily step into a position with better pay and unlimited opportunities for making money.

The sentence for a crime of this kind is "a life-time of drudgery." Trying to make ends meet is a much harder task than making from three to ten times as much money as you are now making. For you can just as easily take advantage of the experience of countless others who, in one swift stroke, have jumped from small pay in blind-alley jobs to incomes of anywhere from \$5,000 to \$10,000 a year.

These Men Investigated and—

As an office worker in Detroit, Mr. B. H. Voss slaved away for \$125 a month. But he saw his one big opportunity—grasped it—and increased his pay to \$500 a month.

As a farmhand, George W. Kearns, of Oklahoma City, grasped the same opportunity. He writes, "Last week I cleared \$306, and this week \$218." And Mr. Kearns earned \$60 a month previously.

Mr. J. L. DeBonis, Chicago, now enjoying magnificent carnings. Before investigating, he was earning \$16 a week as a clerk.

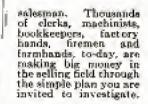

When Charles Berry, of Winterset, Ia., decided that it was a crime to slave for low pay, he was earning \$18 a week. And then the very first month he earned \$1,000.

A whole book could be filled with stories equally amazing of men who have taken this new, quick road to big pay. Nor is there anything exceptional about these men. They were once in the same circumstances that you may be in now. They were discouraged, tired of working for small pay, and disgusted with their prospects. And then, as though by a touch of magic, they were earning salaries that they had never dared hope for.

For they have entered a new field—a field that they had never dreamed of as theirs—one that is not only the most interesting, but the best paying branch of all business-selling.

A Foolish Notion About Salesmen

The average man imagines that, in order to make good in selling, he must be a "born" salesman. Nothing could be further from the truth. There is no such thing as a "born"

Secrets that Make Master Salesmen

No matter what your samings may be, you can quickly learn the accrets of selling that have put thousands into the big-pay class. For the past fifteen years the National Salesmen's Training Association has successfully trained thousands for the selling field—and through its Free Employment Service helped thousands to accure good selling positions.

And through the National Demonstration Method you gain actual experience in overcoming sales problems of all descriptions while studying in your space time at home. Then, through the N. S. T. A. System of Electives, you get specific instructions in how to sell the line or lines you want to handle. In other words, the proved selling plans of master salesmen in all lines are laid before you.

Book on "Modern Salesmanship" Free

Without cost or obligation, we will g-adly mail you a copy of a very interesting book, "Modern Salesmanship." In addition to many interesting facts about salesmanship, it will also give you full information as to how you can become a highly paid salesman. No matter what you may think how, this book will prove to you that it's a crume to slave for low pay when magnificent carnings are within easy reach. There is no obligation, so just fill in the coupon and mail it to-the.

National Salesmen's Training Association Dept. 12-R

National Salesmen's Training Association, Dept. 12-R, Chicago, III.

Send me FREE your book, "Modern Salesmanship," and proof that I can become a Master Salesman. Also send me list of lines with openings for salesman.

"\$60 More a Mont

"LAST night I came home with great news—a \$60 increase in salary! I took the money out of my pocket and asked Mary to count it. You should have seen her face light up when she found the extra \$60. I think she was even happier than I was, for it was the third increase in a year.

"Today I am manager of my department—carning more money than I ever thought it would be possible for me to make. I owe it all to the training I received from the International Correspondence Schools. That little coupon was the means of changing my whole life."

HOW much longer are you going to wait before taking the step that is bound to bring you more money? Isn't it better to start now than to wait for years and then realize what the delay has cost you?

One hour after supper each night spent with the I. C. S. in your own home will prepare you for the position you want in the work you like best.

Don't let another priceless hour go to waste! Without cost or obligation, let us prove that we can help you. Mark and mail this coupon.

lt you were dying to-night

and I offered you something that would give you ten years more to live, would you take it? You'd grab it. Well, fellows, I've got it, but don't wait till you're dying or it won't do you a hit of good. It will then be too late. Right now is the time. To-morrow, or any day, some disease will get you and if you have not equipped yourself to fight it off, you're gone. I don't chain to cure disease. I am not a medical doctor, but I'll put you in such condition that the doctor will starve to death waiting for you to take sick. Can you imagine a mesquite trying to hite a brick wall? A fine chance.

A Re-built Man

I like to get the weak ones. I delight in getting hold of a man who has been turned down as hopebold of a men who has been turned down as hopeless by others. It's easy enough to faish a task that's more than halfdone. Butgive me the weak, sickly chap and watch him grow stronger. That's what I like, It's fun to me because I know I can do it and I like to give the other fellow the laugh. I don't just give you a veneer of muscle that looks good to others. I work on you both inside and out. I not only put big, massive arms and legs on you, but I build up those inner muscles that surround your vital organs. The kind that give you real pen and energy, the kind kind that give you real pep and energy, the kind that fire you with ambition and the courage to tackle anything set before you.

All I Ask Is Ninety Days

Who says it takes years to get in shape? Show me the man who makes any such claims and I'll make him cut his words. I'll put one full inch on your arm in just 30 days. Yes, and two full on your arm in just 30 days. Yes, and two full inches on your chest in the same length of time. Meanwhile, I'm putting life and pep into your old back-bone. And from then on, just watch 'em grow. At the end of thirty days you won't know yourself. Your whole body will take on an entirely different appearance. But you've only started. Now comes the real works. I've only built my foundation. I want just 60 days more (90 in all) and you'll make those friends of yours who think they're atrong look like something the ent dragged in.

A Real Man

When I'm through with you, you're a real man. The kind that can prove it. You will be able to do things that you had thought impossible. And the beauty of it is you keep on going. Your deep full chest breathes in rich pure air, stimulating your blood and making you just bubble over with vim and vitality. Your have the flash to your eye and the pep to your step that will make you admired and sought after in both the business and social world.

This is no idle prattle, fellows. If you doubt me, make me prove it. Go shead. I like it. I have already done this for thousands of others and my records are unchallenged. What I have done for them. I will do for you. Come, then, for time flies and every day counts. Let this very day be the beginning of new life to you.

Send for my book

It is check full of large size photographs of both myself and my numerous pupils. Also contains a treatise on the human body and what can be done with it. This book is bound to interest you and thrill you. It will be an impetue—an inspiration to every red blooded man. I could easily collect a big price for a book of this kind just as others are now stoling, but I want every man and boy who is interested to just send the attached coupon and the book is his absolutely free. All I sek you to cover is the price of wrapping and postage—10 cents. Remember this does not obligate you in any way. I want you to have it. So it's you are to send me, without any obligation on a turning point in your life to-day. So tear off the coupon and mail at once while it is on your mind.

Men Wanted

\$150 to \$400 a Month

is actually being made by good mechanics—not just in a few cases but as a general rule. Hundreds of letters from our former students prove that "Iowa State" trained men are getting the big-paying jobs or making a success of their own business. The whole United States is a field of opportunity for you, once you learn motor mechanics right. Trained men are wanted everywhere.

Be a trained man—learn a trade—get out of the low-wage class and earn real money. We extend a real helping hand—we help you get ahead thru your own efforts—that's the greatest assistance that can be offered to any man—to help him help himself—that's the one big reason for this school's existence. If you could read all the inspiring letters we get from former students—how quickly they spot trouble, how successfully they perform all

spot trouble, how successfully they perform all kinds of repair jobs, what big money they're making—you'd be confident of your own chances for success. For instance, read this letter from Burke Grieme:—

"My \$23,000 garage and equipment is the result of my course in the lowe State Auto & Tractor School. I had no gas engine experience, but I had the ambition to get ahead, so I took a seven weeks' course in the Iowa State Auto & Tractor School and wentinto business for myself. Today I own and conduct a big business."

Master Big Shop Standard Methods in 7 Weeks

Here you get a thorough, standard, practical training in the care, repair and operation of autos, trucks, trackes, stationary gas engines and acropiane nechanics, all in one course—all for one amail price. You work with tools and modern equipment—not books. Our test and trouble work alone is worth the price of the entire course. No education or experience required. No age limit. Life scholarships.

Y. M. C. A. Membership and a night Business Course included—no extra charge.

Big free book Tells all about the big opchanges and our practical big shop standards of instruction. Write for it,

king Drawings like these

rawing Outfit Furnished FRA

You need no artistic talent or "pull." In a few months with our help you can be alongside the best of them, earning enough money to live on and to lay some aside.—Here's how,

Learn Mechanical Drawing

That means Big Money for you, Shorter Hours, Quick Promotion. The real opportunities for success in Mechanical Drawing today are big as compared with other fields. Mechanical Drawing or Drafting is specialized knowledge. It is power to succeed.

Big Salaries

\$35 to \$55 a week is only a beginning. \$140 a week and up is within your grasp as a practical Mechanical Draftsman.

Quick Promotion

You can climb up and up to salary and position—from Draftsman to Chief Draftsman—to Chief Engineer—to Production Manager—and so on up. You can also make hig money on the side in your spare time, in addition to your regular salary. Then when the opportunity comes, you can go into business for yourself, as many others have done.

Permanent Employment

You won't have to stand around looking for a job. Properly trained draftsmen are always in demand. Hadrouds, Manufacturing Plants, Electrical Works, Engineering and Construction Houses and United States Government Departments always need trained draftsmen. Even when men in other lines of work are without positions, the draftsman is usually on the igh at road ray. on the job at good, pay.

Get the Right Training

"Columbia" training is simple and sure, yet complete and practical. By Roy C. Claffin's improved "Columbia" method of practical Mechanical Drawing you can become a master Mechanical Dratisman in a few months of pleasant, easy bone study, under Mr. Claffin's personal supervision. No troublesome, fancy theories—no difficult mathematics to master—just the plain, common-sense brass tooks of Drafting. And after that, if you want it, you receive free training in a specialized branch of drafting, through your choice of one of our post-graduate courses. one of our post-graduate courses.

"Columbia" Draftsmen Are in Demand

The largest concerns in the country, including the United States Government, employ Columbia graduated draftsmen. Openings for draftsmen in Government Departments carry starting salaries ranging from \$5.20 to \$15.04 per day—and it is generally recognized that salaries outside of government service are still higher.

Wonderful opportunities await thousands of men. Millions of automobiles need expert attention. Every street and road is filled with them. Government statistics show nearly twelve million automobiles in the United States which must be kept in running order; twelve

million batteries needing attention; fifty million tires to repair—and only fifty thousand garages to do this work. No wonder they need help!
Why not be one of the trained men to handle these jobs and make the big pay? Come to Detroit—
the automobile center of the world—and get
your training at the Michigan State Automobile
School—the school endersed by the biggest auto
factories in the world.

Learn the Automobile Business

—the world's greatest industry. Automobiles are a necessity and must be properly cared for. Trained men are needed everywhere. The M. S. A. S. gives you the necessary training in a thorough and practical manner. Located in Detroit, the Heart of the Auto Industry, it is surrounded by the biggest automobile factories in the world. Factory managers and executives give our students their fullest co-operation. They give practical and heightil lectures on every phase of the auto bedastry—an exclusive feature with the M. S. A. S., invaluable to our students.

M. S. A. S. Interruptions are bleet-easily instead from every one appealable in his base and embhasiastly about his work. They along a loss personal contact and from off workpression with such angles which helps to make your steadies pleasant and your recover descript.

Are You Climbing To Bigger Pay? -Or Are You Watching Others Climb?

Any number of routine men at the foot of the ascent-and all of them wondering how they can get up higher!

Out of the crowd, now and then, a man makes a

start-he begins to climb.

"A mighty stiff grade" -that's the way the first big step appears to the man who is standing still.

He has no confidence.

"Mighty good sport"—that's the way the event strikes the man who is climbing. The thing that perplexes him is why in the world he didn't get into action sooner.

The power that carries him up the grade to a bigger job?—Confidence in his own ability.

And the thing that gives him confidence—the only thing that can give a man real and dependable confidence?—Specialized training!

During the last fourteen years more than 350,000 ambitious men, enrolled with LaSalle Extension University, have broken away from the crowd and

are on their way to bigger obs and splendid incomes.

When Charles S. Jones took up home-study training in Higher Accountancy under the LaSalle Problem Method, he was earning only \$100 a month. Three years later, on the letterhead of Henry & Jones, Certified Accountants, El Paso, Texas, he writes as follows:

"My income is a trifle in excess of \$8,000 and I am just beginning to grow. I have recently enrolled for your full Law course and expect to complete my business education with LaSalle."

James C. Pitton, of Tacoma, Washington, writes: "I have your course in Business Management to thank for the position I now hold. When I took up your work I was barely making a living. Today I sit in the manager's chair of one of the largest financial institutions in the United States and Canada. My earnings this year will be in the neighborhood of \$10,000 and I have the greatest opportunity that any man could wish for in the way of promotion to bigger things."

During only three months' time as many as 1089 LaSalle members wrote to the University telling of the raises they had received as a result of homestudy training under the Problem Method. The majority of these men had not yet completed their courses, yet the average increase per man was 56%.

To the man unacquainted with the LaSalle Problem Method, results so prompt and definite seem extraordinary. As a matter of fact, anything else would be extraordinary-for the Problem Method represents just the difference between reading how to do a thing and actually doing it for oneself. other words the LaSalle member masters the principles of business by solving actual business problems - under the direction of some of the ablest men in their respective fields in America.

Which do you see ahead of you in the next twelve months—the cliff, or the path that will take you to the top?

If you are determined to climb, you should find out at once about the LaSalle Problem Method and how it can direct you to a higger job. The coupon will bring you full information, together with particulars of our convenient-payment plan; also your free copy of that inspiring book—"Ten Years' Pro-

motion in One." Break away from the men v men who would make you thin	sho are holding you back—the k that "you haven't a chance."

NEW EASY WAY TO LEARN In Chicago or at Home

The automobile business is here to stay. The last few years have been only a start. Tremelidous additional expansion is on the way. And the highest paid and unfrowded branch of this enormous field needs year. There are plenty of auto involutions to take up a bearing, tighten a boil, grind out carbon. But, suppose your starter won't start, your battery won't charge, your lights won't light. Just try to get his ant. They're a Chinese puzzle to the average mechanic. You'll visit from 5 to 10 garages before you find an Automotive Electricias. In a short time you tree can become a nighty-paid Automotive Rhectrician who knows his work and his worth—not a dabiler or a guesser. The special method developed by the Ambu Hagheering fustione does not saturate you in theories and rules—it shows how to do things and why to do them. Things ordinarity considered complicated are now made amazingly easy.

OR IN CHICAGO

EWAIND OF HI Does Away With Dirty Coal and Wood

No more fires to build, bank or watch—no more dirty heavy coal to carry and lift—no more clouds of ashes to breathe or back-breaking scuttles to empty—no more heating problems—no more cold rooms in Winter—no more suffering from lack of quick fires in uncertain Fall and Spring—no more worries about coal shortages, poor quality or high prices since this Wonderful New Invention.

3 Times the Heat of Coal—at Turn of Valve

Here is the amazing new kind of best that has ended forever the days of woman's back-breaking servitude to a bot mussy, stove or armacel. The wonderful invention of Mr. B. M. Oliver of St. Louis, in one minute, turns any coal or wood burner into a modern, up-to-

Cheaper Than Coal and Wood

Mr. Oliver calls his invention the Oliver Improved Oli-Gas Burner, because it uses 95% air and only 5% coal oil (ordinary kerosens)—the cheapest fuel there is, turning them into an actual gas that burns with an intensely bot, clean flame. Saves its cost in cleaning bills alone.

Fits All Stoves—Any Kind or Size

Mr. Oliver's wonderful invention is made in sixteen different models
to fit any kind of cook stove, heating stove or furnace. Doesn't change your stove, Simply sets in
firebox. Easily slipped in in one minute. Absointely safe. It lasts a lifetime. Baves your stove.

You can absolutely depend upon your Oliver to heat your rooms in coldest Winter weather—if gives 3 stones the heat of coul. And you needed worry about the high price of coul. Install this amazing new kind of heat and you can map your 1800 a needed-alth a day space your fingers at coal shortsgree, poor quality or high prices.

Your Oliver burns the obcapest and most reliable fuel there is, berosene. Just turn the valve and you have beat was much or as little as you need. Physicians recommend the Oliver as a sure safeguard against colds influence, etc. colds, influenza, etc

He warry about heat when you defi-get 3 closes the best of coal by insti-turning a valve. No coal, wood, ushes.

Use It 30 Days—FREE

Now, once and for all time do away with household dirt and drudgery. End ashes, dirt, smoke, eder, chopping, shoveling, carrying, dirty, heavy coal and wood. Scott immediately for the FREE ATTRACTIVE 800 KLET, "New Kind of Heat," telling all about this amazing new invention. Shows exactly how it works, how it is different from all other burners and tells how you can use it in your store. 30 days, FEEE. The immen Olive Iron-Clad Monry-Back Guarantee propagate sore.

Send for Big Offer

If you write at case you will be in time to receive Mr. Oliver's very law, introductory price offer and M-day, five Trial. Get your Oliver installed investigately, before as id weather aris in.

I'm as Good a Man as Jim!"

"They made him manager today, at a fine in-crease in salary. He's the fourth man in the office to be promoted since January. And all were picked for the same reason-they had studied in spare time with the International Correspondence Schools and learned to do some one thing better than the rest of us.

"I've thought it all out, Grace. I'm as good a man as any one of them. All I need is special training—and I'm going to get it. If the I.C.S. can raise other men's salaries it can raise mine. If it can bring a better home with more comforts to Jim and his family it can do it for us. See this coupon? It means my start toward a better job and I'm going to mail it to Scranton tonight!"

Thousands of men now know the joy of happy, presperous homes because they let the International Correspondence Schools prepare them in spare hours for bigger work and better pay. You will find them in offices, shops, stores, mills, mines, factories, on railroads—everywhere.

Why don't you study some one thing and get ready for a real job, at a salary that will give your wife and children the things you would like them to have?

You can do it! Pick the position you want in the work you like best and the I. C. S. will prepare you for it right in your own home, in your spare time—you need not lose a day or a dollar from your present occupation.

Yes, you can do it! More than two million have done it in the last thirty years. More than 150,000 are doing it right now. Join them without another day's delay. Mark and mail this coupon!

thing

You Want to Earn Big Money!

And you will not be satisfied unless you earn steady promotion. But are you prepared for the job shead of you? Do you measure up to the standard that insures success? For a more responsible position a fairly good education is necessary. To write a sensible business letter, to prepare estimates, to figure cost and to compute interest, you must have a certain amount of preparation. All this you must be able to do before you will carn promotion,

Many business houses here no men whose expertal known.

Many business houses hire no men whose general know-ledge is not equal to a high school course. Why? Because big business refuses to burden itself with men who are barred from promotion by the lack of elementary education.

Can You Qualify for a Better Position

We have a plan whereby you can. We can give you a complete but simplified high school course in two years, giving you all the essentials that form the foundation of practical business. It will prepare you to hold your own where competition is keen and exacting. Do not doubt your ability, but make up your mind to it and you will soon have the requirements that will bring you success and big money. YOU CAN DO IT.

Let us show you how to get on the road to success. It will not cost you a single working hour. Write today. It costs you nothing but a stamp,

See How Easy It Is To Learn Music This New Way

JOU know how easy it is to put letters together and form words, once you have learned the alphabet. Playing a musical instrument is not very much different. Once you learn

the notes, playing melodies on the mandolin, piane or violin. is simply a matter of putting the notes together correctly.

The first note shown above is F. Whether you are singing from notes, playing the piano or banjo or any other musical instrument, that note in the first space is always F. The four

notes indicated are F, A, C, E, easy to remember because they spell the word "face." Certain strings on the mandolin, certain keys on the piano, represent these same notes—and once you learn them, playing melodies on the instrument is largely a matter of following the notes.

Anyone can now learn to play a musical instrument at home, without a teacher. A new sim-plified method of teaching reduces all music to its simplest possible form. You can now master singing, piano-playing, or any musical instrument you wish right at home, quickly, easily, without endless study and practice. and practice.

Practice is essential, of course— but it's fun the new way. You'll begin to play melodies almost from the start. The "print-and-picture" method of self-teaching is fascinating;

it's simply a matter of following one interesting step after another. You learn that the note in the first space is is F. Thereafter you will always be able to read F and play it whenever you see it. Just as you are able to recognize the letters that make a word, you will be able to recognize and

play the notes that make a nickely. It's easy, inter-

You don't have to know anything whatever about music to learn to play a musical instrument this new way. You don't have to pin yourself down to regular hours, to regu-lar classes. You practice whenever you can learn as quickly as you please. All the intricate "mys-teries" of music have been reduced to a method

each step is made as clear as ABC. Thousands have already learned to play their favorite musical instruments this aplendid new, quick way.

LEARN TO PLAY ANY INSTRUMENT Plana.

Mandelin Drums and Traps Harmony and Composition Sight Singing Ukulele Pinna Organ Violin Banjo Clarinat Fluta Harp Cornat 'Callo Guillar Piccolo Trambeno Saxaphone Hawaiian Steel Guitar Voice and Speech Culture Actomotic Fieger Control

You Can Play Your Favorite Instrument Three Months From Today

If you are dissatisfied with your present work, let music act as the stepping-stone into a new career. If you long for a bobby, a means of self-expression, let music be the new interest in your life. If you wish to be a social favorite, if you wish to gain popularity—choose your favorite instrument, and through the wonderful home-study method of the U. S. Selool of Music, play it three months from today.

You can do it. Youngsters of 10 to 12 years have done it, and men as old as 60 have found new interest and enjoyment in learning how to play a musical instrument. You don't have to listen while others entertain any longer. YOU can be the center of attraction, the talented person who holds the audience fascinated.

Is it the piano you wish to play, the

mandolin, the violin, the saxophone? Do you want to learn how to sing from notes? Are you eager to be able to play "jazz" on the clarinet, the banjo?

Free Book Explains New Method

It costs you nothing and obligates you in no way whatever to send for our iree book called "Music Lessons in Your Own Home." Everyone who is interested in nusic should send at once for this valuable book. It not only explains the wonderful new simplified method of learning music, but tells about a special short time offer now being made to music-lovers.

Mail this coupon at once for your copy. Remember, it obligates you in no way whatever—it's free. But act now before the supply is exhausted. U. S. SCHOOL OF MUSIC, 710 Brunswick Building, New York.

He Earns \$10,000 a Year

This executive is one of the officers of a big corporation; the carns \$1f,000 a year, and is still in his early thirties.

"He has a mighty good business head"—that's how the directors speak of him, "He's keen at a business problem, quick to pick out the essential points, sure in his decisions"—that's why the President is for him. "When he recommends a policy," declares the General Manager, "I know it's sound from a legal standpoint."

A big salary—\$10,000 a year—but this man has an asset that is wirely important in the management of big affairs—he is a law trained man.

His Chance is Yours!

Why let the really big opportunities slip away from you—simply for lack of training?

Right in your own home, under the LaSalle Problem Method, you can study the same cases you would read at the resident universities, master the fundamental principles of law set forth by some of the most eminent authorities in the profession, develop under their direction a sound understanding of business relationships, a power for keen and logical thinking, a facility for analyzing dusiness problems that in later years will make you the man the directors pick for the bigger job. Read these statements, testifying to the thoroness and income-value of LaSalle training:

"The Problem Method increased my salary

"The Problem Method increased my salary nearly 180%."
"Pussed far examination with accord highest bonors in a close of seventy-one."
"Salary doubled in six months."
"Pussed bar examination, third in a class of fucuty-three, the youngest man who ever passed the examination in this state."

Send today for full particulars regarding LaSalle home-study training, together with details of our convenient payment plan; also your free copy of that inspiring book, "Teo Years' Promotion in One." Mail the coupon NOW.

Present Position Address.

Please Mention Popular Mechanics

Do You Make these Mistakes

tion or does it prove that you are a person of culture and refinement? English is the one weapon you must use every day. Here is how you can improve it almost at once, Here is

how you can improve it almost at once.

ANY people say, "Did you hear from him today?" They should say, "Have you heard from him today?" Some seeple spell catendar "calender" or "calander." Still others say "between you and I," instead of "between you and me." It is astonishing how many people use "who" for "whom," and misgronoutere the simplest words. Few people know whether to spell certain words with one or two "c's" or "n's" or "r's," or with "ie" or "ei," and when to use commas in order to make their mestring absolutely clear. And most prople use only remained words—colorless, flut, ordinary. Their speech and their letters are tileless, monetonous, lunsdram. Every time they talk or write they show themselves lucking in the essential points of English.

An unissed command of English combles you to present your iseas clearly, forcefully, convincingly. If your English is incorrect it harts you more than you will ever know, for people are too polite to tell you about your mistakes.

Wonderful New Invention.

Wonderful New Invention.

For five years Mr. Cody worked almost day and night on the study of the problem, "How to make correct liability in speaking and writing stick in your mlod." After countries experiments be finally invented a simple method by which you can acquire a better command of the English language in only 15 minutes a day. Now you can stop making the mistakes in English which have been hurting you. Mr. Cody's students have secured more improvement in five weeks than had previously been obtained by other pupils in two yours?

Learn by Habit—Not by Rules

Under old facthods, rules are motosted, but correct habits are not formed. Finally the trikes themselves are forgotten. The new sherwin Cody method provides for the formation of correct habits by constantly calling attention only to the mistakes you make.

One of the wenderful things about Mr. Cody's course is the speed with wisch these habit-forming practice drills can be carried tun. You can write the answers to fifty questions in 15 minutes and correct your work in 5 minutes more. The strategy and work of copying have been ended by Mr. Cody. You concentrate always on your mistakes until it becomes "second nature" to speak and write correctly.

Water for Free Donly.

The Secret of Making People Say "Yes"

Learn it! Use it! It is the most important thing for you to know—the greatest money-making power you can possess.

HAT you want to know—what everybody wants to know—is how to make people say "yes."

It is the big thing we are all trying to do. It is the one great secret of success.

Without that knowledge you cannot expect to accomplish anything worth

The attainment of parition, prosperity and power

depend upon it.

Doing business of any kind getting a position—obtaining more salary—selling goods or services -collecting money -securing loans-raising cap-ital, etc., depends in the final analysis, simply and solely upon your ability to make people say "yes,"

Brings Sure Advancement

And there are only two methods you can use in making people say "yes" talking and writing. Therefore, it is perfectly plain that a knowledge of effective English-forceful language-powerful, persua-size, positive words-is of

the utmost importance to every man and woman who is ambitious to forge shead and make more money.

The ability to make your words strike home—commending attention—arousing interest—creating good-will—securing influential friends—making sales collecting accounts—obtaining credit—will bring you greater business, social and financial advance-ment than any other faculty you can acquire.

Increases Your Earning Power

The scientific way of using English in a way that makes people say "yes" has been discovered, after years of study, by Frederick Houk Law, Ph.D., the prominent New York teacher, lecturer and writer in subjects relating to the practical use of the spoken and written word.

This important new work of Dr. Law's—the biggest thing he has ever done—makes it easy and fateresting for you to learn how to use English that makes money-how to talk and write scientifically, using clear, positive, persuasive language instead of weak, havy, negative language.

And the very minute you learn this important secret, you will become a more powerful person, capable of influencing others and earning more money, no matter what your daily task may be.

Clip the Coupon

It is, of course, impossible to tell you, in the small space of a magazine advertisement, all about the many immedisely important benefits that are suce to come to you, in every activity of your life, just as seen as you have learned Dr. Law's simple, practical and scirnific method of using the English language in talking and writing in a way that makes people say "yes," instead of "no."

Therefore, we have prepared a backlet entitled The Secret of making People Say "Yes," a copy of which may be secured by you if you will simply sign and mail the "Free Book Coupon."

This booklet will be a revelation to you. You will find it one of the most marprising and faxioniting things you ever read.

fascinating things you ever read.

It will show you a sure way—
and an intensely intensting
way—to advance more rapidly
—make more friends—make
more money—become incre

more money—become more popular—achieve grenter prommence—win the admiration and regard of those you care for. It will show you how to multiply your power of accomplishment by multiplying your ability to persuade others to do what you want them to do. It gives you the power of contiction and persuacion, which is the real secret of success.

Whether the answer is "Yes" or "No" depends on what you say and how you say it.

Takes Only a Minute

at it were necessary for you to take a week off in order to get a copy of The Secret of Making People Say "Yes," it would pay you well to do it. But it isn't. A minute's time and a postage stamp is all that is required.

Don't let the case with which

Stamp is all that is required.

Don't let the ease with which you can obtain this valuable booklet cause you to underestimate its value.

There is no way of measuring it advance the immense value to you of Dr. Law's secret of getting people to do the things you want them to do. But by showing you how to uncover greater opportunities—handle bigger deals—make more sales. greater opportunities—mainteringer deals—make more subsequent a better position—increase your salary—it will quickly prove to you that it is the most valuable booklet you ever got for nothing, and that in mailing the coupon you took a sure step toward greater personal, social, business and financial achievement. Independent Corporation, Dept. BE-t510, 22 West 19th St., New York.

Do You Like to Draw?

Here Is a Simple, Easy Way to Draw a Comic Face

TRY IT

Make a square with pencil, then add to it with twicd as shown in the small squares above. Erase all pencil guide lines after the drawing is completed.

We will not give you any "grand prize," if you draw this picture. Nor will we claim to make you "rich in a week." But if you are anxious to develop your talent with a successful cartoonist, so you can make money, send a copy of this picture with six cents in stamps for portfolio of cartoons and sample lesson plate, and let us explain more in detail. Some of the most successful cartoonists are former students of this school. It is not hard to learn to draw originals when you are shown how in a practical way.

THE W. L. EVANS SCHOOL OF CARTOONING

"The School That Has the Reputation"
821 Leader Bldg. CLEVELAND, OHIO

Don't Wait for Opportunity--Make It!

DO YOU, an ambitious man, know that every great executive has made his own opportunities. That any successful man does not wait for someone else to act, but forces action. Before you can force action and command a high position you must know fundamentals and know them well.

One of the greatest helps to success in business today is a thorough knowledge of accounting.

If you are an employer of men you realise you should know how to keep books and analyze figures. If you are working for someone else you will find such knowledge your greatest help to progress. You cannot progress very far without this knowledge.

Thousands of opportunities paying big salaries are open now to men and women who know how to record and analyse the statistics of business.

Why not push yourself into one of these positions?

We Will Teach You in Thirty Days

We have an easily understood rourse in simplified bookkeeping and accounting. It was written by an expert accountant and educator of national reputation. One basic rule of thirteen words covers all transactions. Students write us that they are able to hold good positions as bookkeepers and accountants after only thirty days of study.

Quick Assets—Free Send for a Copy of this Remarkable Book

It is check full of information for people who want to forge ahead. It explains the course in detail and shows why a knowledge of accounting takes you out of the crowd and forces advancement. It tells of men and women who have gained high executive positions through a knowledge of these subjects. It's free for the asking and places you under no obligation. Send for it today. You'il find it interesting as well as instructive.

Federal School of Accounting 1003 Federal Schools Bldg., Minneapolis, Minn.

"Here's Where We Got Our Start"

"Look, Nell—this coupon! Remember the night you urged me to send it in to Scranton? Then how happy we were when I came home with the news of my first promotion? We owe it all, Nell, my place as Manager, our home, our comforts—to this coupon."

Thousands upon thousands of men now know the joy of happy, prosperous homes because they let the International Correspondence Schools prepare them in their spare time for bigger work. You will find them in city, town and country in office, factory, shop, store, mine and mill, on farms and on railroads. There are clerks who became Advertising Managers, Salesmen and Executives; carpenters who became Architects and Con-tractors; mechanics who became Engineers and Electrical Experts; men and boys who rose from nothing to splendid responsible positions.

More than two million men and women in the last 30 years have advanced themselves in position and salary through I. C. S. help. Over 120,000 are studying right now. You can join them and get in line for promotion.

The first step to success in the I. C. S. way is to choose our career from this list and mark and mail this coupen here and now.

17%		44000 8	of John H. Clah	al land	BA A HE CAN

Pept. 1222-K, 42nd St. and Madison Ave., New York
You may send me on approval the Marshall Stillman Course.

I will deposit 97c with the postman, with the understanding that if, after 10 days, I mish to return the course I may do so and my money will be refunded. If I keep the course I am simply to send you two dollars in that payment.

Name		
------	--	--

Adding-w.,,,,,,,

You're not playing fair with those who love and depend upon you unless you prepare yourself. And think of the exert yet remissing. There's harries of tue, in friendly boxing bouts and wrestling matches. You may even box rings around that "chapwho thinks he knows it all" or pin his shoulders to the mat.

Marshall Stiffman teaches you the game right in your own homefrom the simplest rudiments of hitting and guarding to the most scientific blows and guards, such as the Benny Leonard Triple, the Jack Dempey Triple, the Fitzstamons Shift, str. So spickly do pupils learn that many outbox bigger opponents after only twoweeks' training.

recent training.

In wrestling you learn 15 Min. Hum holds—how to disarm an appearent, how to break a strangle hold, etc.—and 14 of the less mat holds—the Gotch Tee Hold, the Stepher Scissor Hold, the Head-lock, etc.

With the course you get a Free History of 69 Famous Boxers, with their pictures and "linside" stories about them.

SEND NO MONEY: Simply fill in and must the course in your hands, merely deposit 97 cents with the personant. Then exhibite the course for 10 days—try it thoroughly. At the end of 10 days either send us the small balance of \$2 in final payment or return the course, and we'll send rour deposit back. Main the reamon to Marchall Stillman Association, Desc. 1222-K, 42st St. and Madisun Ave., New York.

Be An Auto Expert

I WILL MAKE YOU ONE!—by my complete, practical, simple, easy, auto, truck and tractor course—which you can master in your home—at your leisure—without giving up your present job. I will make you a "Cooke Trained Expert." With that title you can command respect—and big money.

When you work with me, you don't just "learn" things. YOU DO THINGS!
YOU BEGIN TO ACHIEVE RIGHT FROM THE START.

Choose Your Career NOW!

Think of it! Eleven million motor driven vehicles in this country today-and

any one of them is liable to need attention any minute. The automobile field is a "gold field." STAKE YOUR CLAIM NOW AND AVOID THE RUSH. Choose the right career—show some "pep" and enthusiasm—and you can be your own boss. Any one of the following careers is open to you. TAKE YOUR CHOICE:

Owner or Manager of a Garage; Demonstrator and Saleman; Tractor Engineer; Auto Mechanic; Auto Electrician; Battery Expert; Welder; Tire Vulcanizer; Truck Driver; Chauffeur.

\$150 in 3 days!

Men who have worked with me are now earn-Men who have worked with me are now earning big incomes. You just ought to read the heart warming letters I receive from grateful students who feel that they owe their success in life to me. One tells of making \$150 in three days. Another says: "The man I used to assist is now my helper!" And that's just the point! One man, under my guidance, goes ahead, while the self-satisfied fellow stands still—or goes backward! Enroll with me and go ahead! I promise to push you ahead.

Send for my free book and learn all about my course—just how I work with my men—how I give them practical work to do—how they secure the aid and advice of my big corps of experts—etc., etc. I can't tell you all about it here—BUT SEND FOR MY BOOK!

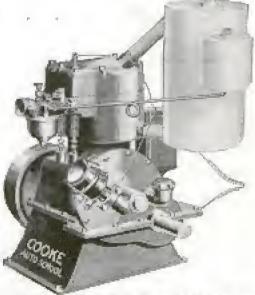

Auto Design—4 Horse Power

Write me at once and learn how you can get this gasoline motor FREE! It's essenget this gasoline motor FRESI It's essentially like the biggest auto motors made—but, on account of its smaller size and the fact that it is mounted on a block, it is much more convenient to work with. I make you this remarkable offer because I want you to DO THINGS—instead of merely learning routine "lessons." No text books—but reat work! That's my method. That's how I make "Cooke Trained Experts." FIND OUT ABOUT MY FREE MOTOR OFFER AT ONCE!

NOW is the time to get started on a NOW is the time to get started on a career. Send for my free book, and learn all about the possibilities—yes—the certainties in the automobile field. You just didn't realize they were there—but I EHOW YOU IN MY BOOK! You can have my Complete Auto Course—or you can have a Special Electric-Auto Course or a Special Battery Course. SEND THE COUPON TODAY!

HARD times don't worry the Auto Expert. He is in constant demand. Did you ever know of an experienced auto engineer hunting a job? No, and you never will. The job hunts him.

Just consider for a moment that there are 9,000,000 automobiles in this country today. These millions of cars are in constant need for experts—repairmen and auto engineers.

A smattering knowledge won't get you very far in this line, but if you are willing to get down to brass tacks and really master this well paying line of work, then there will be no limit to what you can carn.

It is only one step from Auto Expert to Garage Owner, but think of the big money that is earned by the up-to-date garage. Here is your chance to become independent—to be your own boss with our help. Now don't say "Well, I'll think about it," but make up your mind right now to be a real success.

The coupon will give you full information on how to do it. Fill out and send it in right now while you are thinking about it.

Greatest Building Boom in History Provides Big Jobs for Trained Men in the Building Trades

Big Pay for Those Who Can Superintend Construction, Take Contracts, Read Plans, Estimate Costs, Etc.

There is a big building boom coming—it's here now! Plenty of labor can still be had but expert builders who can direct and put work through are scarce. They can get big money—in fact, can name their own price. There are great days of opportunity just ahead for wide-awake brick-layers, carpenters, plumbers, plasterers and other builders who have training to back up their practical experience.

Skill at your trade in the building industry is good—but not enough. It is brains and training that put men in the big-money class today. The workman who knows more than those around him becomes foreman or superintendent, and later on often starts his own business. And the contractor who knows best how to estimate on jobs and to employ and direct men gets the paying business.

America's Oldest and Largest School for Builders Will Train You at Home in Your Spare Time

Hundreds of carpenters, bricklayers, and other builders attend our Chicago school. For twenty years we have been training building experts, and hundreds of our graduates are now topnotchers in the building business. You can get this same training at home in spare time—by mail. Same practical blue print plans, same estimates, same lessons, same expert teachers to guide you by easy stages to success in short time.

at home in spare time—by mail. Same book "How to Read Prints." Just out. It taken Trial Lesson in the send blue prints, if etc. Text yourself the feet. "I Knew You'd Make Good"

I ALWAYS felt you had it in you to get ahead. But for a time I was airaid your natural ability would be wasted because you had never trained yourself to do any one thing well. Yes, I was airaid you would always be a jack of all trades and master of none.

"But the minute you decided to study in your spare time I knew you'd make good. You seemed more ambitious—more cheerful—more confident of the future. And I knew that your employers couldn't help but notice the difference in your work.

Think what this last promotion means!
More money—more comforts—more of everything worth while. Tom, those hours you spent on that I. C. S. course were the best investment you ever made."

HIOW about you? Are you always going to work for a small salary? Are you going to waste your natural ability all your life? Or are you going to get ahead in a big way? It all depends on what you do with your space time.

Opportunity knocks—this time in the form of that familiar I. C. S. coupon. It may seem like a little thing, but it has been the means of bringing better jobs and bigger salaries to thousands of men.

Mark and mail it today and without obligation or a penny of cost, learn what the I. C. S. can do for you.

- TEAR OUT KERE -INTERNATIONAL CORRESPONDENCE SCHOOLS Box 5675-C. Scranton, Penna.

CAN YOU ANSWER THIS MOVIE PUZZLE?

On the Movie Screen above are the names of 10 Popular Movie Stars, rearranged topsyturyy. The operator played a joke on the audience and you'll admit it was a good one.

To solve the puzzle, and puzzle it is, rearrange the peculiar sentences on the screen so as to correctly spell each star's name. For example, No. 10 is Charlie Chaplin. You know him. If you can name all 10 Stars correctly you can win the \$1,000 or an Oakland Touring Car.

You most likely know the names of the most popular Stars, but just to refresh your mind we are mentioning a few of them:—Constance Talmadge, Otis Skinner, Buster Keaton, Anita Stewart, Charles Ray, Mary Pickford, Charlie Chaplin, Helen Chadwick, Thomas Meighan, Pearl White, Warner Oland, Beverly Bayne, Ralph Ince, Wallace Reid and Dorothy Dalton.

185 "POINTS" WINS FIRST PRIZE

For each name you arrange correctly you will receive 10 "Points" towards the Oakland Touring Car or the \$1,000 in cash, or you will receive 100 "Points" if you arrange all 10 names correctly. You can gain 60 more "Points" by Qualifying your answer. That is, by proving that you have boosted the Big Magazine, FRUIT, GARDEN AND HOME to five people. The final 25 "Points" will be awarded by 3 Judges, whose decision will be absolutely fair and is to be taken as final and without question, to the person making up the largest list of correct words from the name of the 10th Movie Actor listed on the screen above—CHARLIE CHAPLIN. It's easy! Can you make out 10-20-30 words like, are-lie-car-pie-hall, etc. Send in your list of words right away with the names of the 10 Movie Stars. RULES:—Number each word, and in making up your list, don't use proper names, abbreviations, prefixes, and suffixes, or obsolete and archaic words. Webster's Dictionary will be used as Final Authority. Use each letter only as many times as it appears. For example: There are 2 a's, therefore "a" may be used 2 times if necessary in forming a word.

The answer gaining 185 "Points" (which is the maximum), will win the Oakland or the \$1,000. In case of a tie, all tieing contestants will receive a prize identically the same as the prize tied for. Send in your answer TODAY. As soon as it is received, we will send you a FREE circular telling you all about the Big New Magazine, FRUIT, GARDEN AND HOME, to assist you in qualifying.

COSTS NOTHING TO TRY

You will not be asked to subscribe to FRUIT, GARDEN AND HOME, nor to spend a penny in order to win. Just write your answer to the Puzzle on one side of the sheet of paper and PRINT your name and address on the upper right hand corner. Send in your list of words with your solution before October 10th, the Final Day. Do your best and you can win. Answer the Puzzle NOW.

Hook Your Radio Set to These Sensational "A" & "B" RADIOBATS

Enjoy Uninterrupted Operation of your Radio Outfit, Without Battery Noises, Without Constant Adjustment and Without Continual Replacement Expense.

"A" and "B" RADIOBATS for your radio outfit are built on sensational new principles. RADIOBAT "B" as well as "A" is a genuine rechargeable storage battery that eliminates the constant "B" battery replacement expense.

RADIOBATS contain the first successful semi-solid electrolyte. They cannot leak. This principle plus the rugged strength of the RADIOBAT grid has made it unnecessary to use separators of any kind.

RADIOBAT "A" is smaller, lighter in weight and easier to handle than any other "A" battery of equal rating.

RADIOBAT "B" is absolutely quiet in operation. George Gaynor Hyde, well known consulting engineer, after making an entirely independent test of RADIOBAT "B" reports: "The total absence of any noises such as are common to the usual type of "B" battery.

This battery is easily rechargeable at home every three or four months and has on each charge, the life of approximately ten dry cell batteries.

The combination of "A" and "B" RADIOBATS forms "The permanent power UNIT for radio". If you now have a radiophone, replace your present batteries as they give out with "A" and "B" RADIOBATS. If you are expecting to buy or build a radio outfit, you are more fortunate. You can insist on RADIOBATS to start—and avoid all battery troubles and replacement.

Ask your dealer for a RADIOBAT demonstration. In the meantime, send for your copy of the booklet, "The Permanent Power Unit for Radio". Your name on a posteard brings it free.

Electric Fire Truck Has Four-Wheel Drive

FIRE-FIGHTING apparatus has been improved upon to the extent of

motor drives in each wheel and raising or lowering the lad-ders by air and hydraulic pressure. The current for the driving motors is supplied from powerful storage batteries which are suspended beneath the frame of the vehicle. While the wheels anpear to be of the ordinary disk type, they

possess removable covers, so that the mechanism can be quickly and conveniently exposed for proper maintenance. An air compressor, driven by a gasoline

engine, is incorporated in the outfit and furnishes the necessary elevating power equipping large trucks with individual for the heavy ladders, the lowering of

these being accomplished with the aid of oil brakes, or compression cylinders. The action of the ladders is so simple that but one man is required to operate them, thus facilitating the actual fire-fighting work after the apparatus arrives at the scene of the blaze. The ad-

Ladder-Operating Mechanism for Fire Truck, Showing, from Left to Right, the Small Oil Cylinder, the Three Air Cylinders, and the Compressed-Air Tank vantage obtained in many localities by the installation of these virtually noiseless electric trucks is obvious, and it is thought that

they will be adopted by many cities.

PROTECTS SHIRTS OR WAISTS ON AUTOMOBILE TRIPS

Protecting the backs of shirts and waists during a hot and dusty automobile trip, when the occupants naturally per-

The Garment Protector, Shown in Detail in the Insert, as It is Wore, and Also Result of Not Wearing It

spire from the heat of the back upholstery, is possible with a simple arrangement. The contrivance consists of a piece of paper fitted with small adhesive disks which are fastened to the clothing before entering the machine. These shields, or papers, are quickly removed at the termination of the trip, after having prevented the pleasure of the ride from being marred by the prospect of soiled and sometimes ruined garments.

MOUNTAIN PASS HAS NEW ROAD AMONG CLOUDS

The newly completed road through Tioga Pass in the Sierras of California connects Lake Tahoe with Yosemite Valley and puts Lake Mono within reach of tourists who can view from the pass way, which reaches a height of 10,000 feet, some of the most impressive mountain scenery in the world. Mark Twain, who felt the grandeur of the mountains, describes Lake Mono as being "the loneliest tenant of the loneliest spot on earth, under the surface of whose dull waters no living thing existed except a small feathery sort of worm." The route is made safe and convenient to autoists by patrols with trouble cars and by service stations at frequent intervals.

MEN FIGHTING FOREST FIRE AIDED BY AIRPLANE

The airplane further demonstrated its usefulness in lighting forest fires, when a lumber company made use of one this summer in combating a fire that was raging on its property in the Province of Quebec. The plane was first used to reconnoiter the burning area and then to direct the men on the ground to the point where their efforts would accomplish the most. After that the aerial patrol made daily inspections of the fire area, so that the plan of attack could be adapted to any change in the situation. In addition, the plane was used to supply the fighters with food.

DURABLE WIRELESS UMBRELLA HAS DETACHABLE PARTS

'A ball-and-socket joint for the ribs instead of the usual wire-stringing method is one of the many features of an umbrella recently brought out. Other merits are, that solid-brass nickelplated parts are used throughout, except for the steel frame and enameled-steel rod. The ribs can be easily attached or removed, and it is claimed that the cover can be replaced by anyone in only three minutes. Detachable handles of the ordinary type are provided, so that the umbrella may be carried in a suitease or traveling bag. As a woman's or man's style of handle

Left: Neat Appearance of the Wireless Umbrella. Insert: Manner of Attaching Hondle, Also Ball-and-Socker Joint of the Ribs

can be quickly placed on the article, the umbrella is an economical investment.

RAILWAY COACHES REDUCED TO KINDLING WOOD

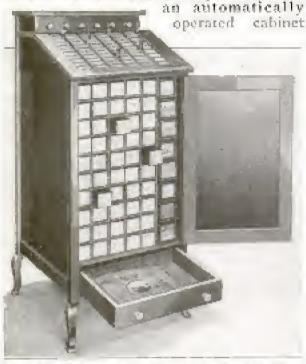

WHEN an engineer on the Missouri Pacific Raifroad failed to beed a block signal near Sulphur Springs, Mo., recently, his limited train, composed of steel cars and running at hall speed, crashed through five heavily loaded wooden coaches of a local train. Thirty-eight persons were killed and 157 injured. The picture gives a general view of the disastrons wheek, and illustrates how the heavy steel tars virtually made kindling wood of the antiquated coaches.

produced by a western man. The top of the cabinet is built at an angle, and has six rows of interchangeable title plates arranged to correspond to the music rolls kept in pigeonholes below. A push button is asothe, head of each column, and between the rows are levers working in slots. When a certain roll is desired, a lever is adjusted to the name of the record wanted, the button at the top is pressed, and the roll slides partly out.

SPECTACULAR ILLUMINATION AT BRAZILIAN EXPOSITION

Brazil is about to celebrate its one hundred years of independence by an international exposition at Rio de Janeiro which will be notable for its wonderfully picturesque setting, for some striking specimens of architecture, and, perhaps more than all, for its spectacular and novel methods of illumination. The exposition will occupy an area of 50 acres, and will include exposition buildings of 13 foreign nations, and many large Brazilian buildings with beautifully planted gardens and parks. At night all will be made brilliant with a system of exposition illumination that is an elaboration of that adopted seven years ago at the San Francisco exposition, and designed by the same man who planned that installation. One striking feature in this illumination will be a so-called "scintillator," consisting of a battery of sixteen 31-inch are searchlights, individually operated, and each provided with a set of five color screens. The searchlight beams will be projected radially, with constantly changing colors, and, in combination with fireworks and streams of water spray and steam, will produce some very interesting effects.

View to be Seen at the Forthcoming International Exposition at Rio de Janeiro, Brazil, Showing Effect of "Scintillator": The Apparatus Consists of a Battery of Sixteen 31-Inch Arc Searchlights Which Throw Their Beams of Light Radially over the Exposition Buildings. One of the New Small High-Speed Torpedo Boats, Recently Acquired by the American Navy, Making a Trial Spin: Of the Three Men Seated Amidships, the Middle One Is Secretary of the Navy Denby. The Boats are Known as "Coastal Motorboats"

NAVY ACQUIRES SMALL SPEEDY TORPEDO BOATS

TWO small high-speed torpedo hoats, known as "coastal motorboats," re-

cently acquired by the U. S. navy from one of the largest speed-boat builders in England, have been assigned to the Naval Torpedo Testing Station, at Alexandria, Va. On their arrival at Norfolk, Va., they made a trial trip to Washington, a distance of 190 miles, which they covered in about 5 hours at an average speed of nearly 37 miles an hour. The experience of the late war showed very clearly that in modern navies small high-speed torpedo boats are

most essential.

The new boats are built with speed hulls, and are fitted with longitudinal troughs

for discharging the torpedo, tail first, over the stern, while the boat is attacking at full speed. The hoat is movingatabout the same speed? as the torpedo, and it has to be skillfully maneuvered to get out of the way of the torpedo, which thus has been fired without any knowledge of the enemy, and without any diminution in the high speed of the attacking boat.

Many of these boats were secretly built for the British navy, and were used most effectively during the latter part

The Two High-Speed Torpedo Boats: The Nearer One Is \$5 Feet Long with Two Torpedo Troughs, Seen at the Stern.
The Smaller Boat Beyond Is 45 Feet Long

of the war against German submarines and mine layers. The two vessels of this type that now form part of the U. S. navy are respectively 45 and 55 feet long, the smaller having only one trough for an 18-inch torpedo, and the larger two. The smaller boat has a width of 9 feet 7 inches and a draft of 2 feet 9 inches, while the larger is 11 feet wide and draws 3 feet 3 inches of water. Each is fitted with the same type of internal-combus-

tion engine, much on the lines of an airplane motor, but the larger boat has two,
while the smaller is propelled by one.
Each motor develops 375 brake horsepower at 1,550 revolutions per minute.
During the war these boats were used
also for mine laying, their shallow draft
allowing them to pass safely over enemy
mine fields, and their high speed enabling
them to escape before being observed and
attacked.

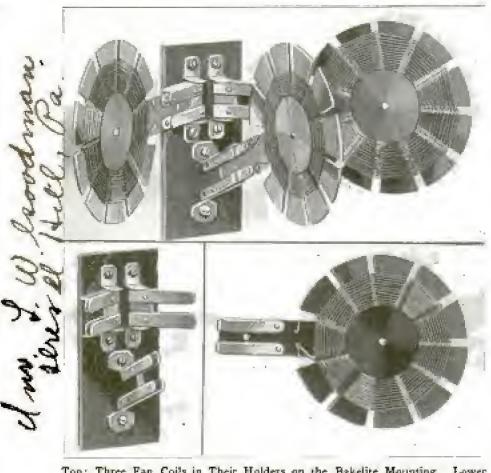

FAN COILS AND MOUNTINGS FOR RADIO SETS

Fan coils, used for tuning in radio sets, are being produced, together with a neat and attractive mounting, by a Pennsyl-

NEW PROTECTIVE MATERIAL FOR RADIOLOGICAL WORK

The necessity of better protective material in connection with radiological work has led to the production in Eng-

land of a new substanc; made in either a pliable or a solid form. former is for such articles as aprons, nurses' overalls, and the lining of tube boxes, while the latter is to be used for panel sections, portable screens, etc. The composition is a trade secret, and the ingredients vary, depending on whether the solid or pliable form is required. In tests, samples of the pliable form of 3.1-millimeter thickness, were found to be equivalent to 1 millimeter of metallic lead, and those of 5.3-millimeter thickness, equivalent to 1.7 millimeter of metallic lead. The results were the same whether the applied voltage to the tube was 100,000 or 120,000 volts. In the solid form, 9.9-millimeter thickness was found to be equivalent to 1.5-millimeter metallic lead, with an applied voltage to the tube of 100,000 volts,

Top: Three Fan Coils in Their Holders on the Bakelite Mounting, Lower Left: Bakelite Mounting, Showing the Two Pivoted and One Stationary Holder. Lower Right: Fan Coil, Showing Neat Construction

vania manufacturer. The coils are made of bakelite and furnished wound with enameled wire, or delivered unwound if the amateur desires to use his own pet combination. The mountings are also of bakelite, with nickeled-brass holders for the coils, one of the holders being stationary, while the other two are pivoted to permit proper adjustment in the delicate task of tuning in. and to 1.3-millimeter metallic lead, with an applied voltage of 120,000 volts. A full-length apron, equal in protection to 1 millimeter of metallic lead, although weighing 19 pounds, has been made, by means of special supporting straps, more comfortable to wear than the lead-rubber variety. In the pliable form it can be produced in widths up to 26 inches and in any reasonable length and thickness.

NEW MOTOR-CAR TESTING APPARATUS GIVES
COMPLETE ROAD DEPENDENT AND GIVES

BY G. H. DACY, hate

tion; Jower butput;

manifold depression, and the changes in

the temperature of the fuel, lubricants.

ENGINEERS of the Bureau of Stand-ards have lately designed an apparatus which accurately measures and

records the performance of a mocar in road tests, and the first of these appliances to be built has just recently undergone trials with pronounced success.

It consists of a flow-meter camera, which makes a photographic record of the gas consumption, and a multiple recorder which keeps tab on 16 distinct and separate operations of

various machinery parts of the automobile. The present equipment is for use on any type of motor car accommodating four or more passengers, but it is expected that it will also be adapted to smaller cars. It takes about one day to equip a car with the testing devices, auother day to make the tests, and a half

day to dismantle the car again. The multiple recorder, which is se-

the tonneau,

fastened to the

keeps track of the car

speed over the road; the

relative air speed; the ac-

tion. After an official try-out of a

motor car, the Fed-

cral engineers will

know more about the automobile than

its makers as regards its ability to handle gas and oil

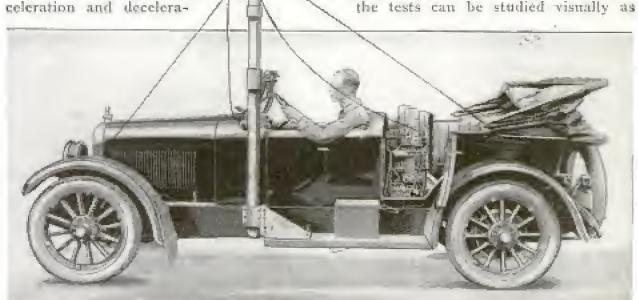

economically and operate efficiently,

Briefly, the record-

er consists of 16

automatic pens

carried for a two hours' test. The camera is so delicate and carefully adjusted that it will photograph the consumption of gasoline even where it occurs at so slow a rate as two drops per second. All the other results of the tests can be studied visually as

The Multiple Recorder, Shown Astached to Tonneau of Car. Gives Performance Data on Important Factors Involved in Motor-Car Operation. The Odd-Looking Device, Having the Appearance of a Weather Vane, is Constructed on the Principle of the Venturi Meter, and Measures the Wind Velocity

POPULAR MECHANICS

they are being made, the picture making being the only operation concealed from view.

One of the test appliances is a doubletubed Venturi meter which is used to record the speed of the car through the air. This curious device looks something like a weather vane. It is made of metal, bolted to the running board, and extends to a height of 4 feet above the top of the car. The device is built on a large scale

so that it can measure air velocities as low as 10 miles an hour.

The test car of the Bureau of Standards was driven over 600 miles of good, had, indifferent, and, in some stretches, almost impassable roads, thus subjecting the engine to every possible kind of a performance and efficiency test. The testing appliances recorded accurately under all circumstances, and were not damaged by the violent jolting and bouncing about of the vehicle.

The flow meter is a vertical tube

slotted parallel to its axis. A light piston runs up and down inside of this tube. The gasoline enters at the bottom and flows through the slot below the piston into a small space between the flow tube and the encircling tube of glass, which permits observation of the position of the piston at any given moment, measurements registered by the multiple recorder are made at exactly the same instant as those obtained by the flow meter by the use of special timing devices on each of the instruments. A celluloid template is used in interpreting the records registered on the plain, unruled paper, 'This template is so graduated, and

provided with calibrated pen paths, that it can be oriented in the desired positions on the record chart and used as the key for working out the conclusions. The pressure, temperature, speed, and timing devices used in connection with the multiple recorder are mounted on shelves at the sides of the recorder placed on the floor of the tonneau and connected to the recording pens by means of link wires. The speed of the motor car under test

Close-Up of Multiple Recorder, Showing Glass-Covered Meter Box with 16 Pens, Each of Which Draws a Line Giving History, during the Test, of Some Individual Peature Entering into Operation of Automobile under Test

eter. It is geared to one of the front wheels of the machine, its spindle being fitted with a small pinion and quadrant which are linked to one of the registering pens. The device has no time lag and records the average speed attained by the car during the preceding two seconds. Data regarding engine speed are obtained from measurements of the car speed and the known ratio between the rear-wheel axle and transmission gearing. The data on the

is recorded by

use of an air-

plane tachom-

quantity of air used by the engine are obtained from pressure differences produced by the flow of air used by the carburctor through the Venturi meter.

Automotive experts from all parts of the country have examined the new apparatus and pronounced it satisfactory. They predict improvement in automobileengine construction as a result of the invention.

(The first aerial stowaway arrived in Cleveland the other day after a ride from Detroit, where he had sought a quiet sleeping place in the hull of a mail cruiser that was anchored in the harbor.

Steel Mats Laid on Foundation Ready for Imbedding into Concrete Subpavement of Improved Highway: This Construction has been Found to Meet the Requirements of Heavy Traffic and Eliminate Troublesome Surface Cracks

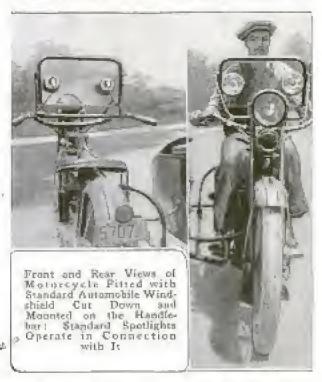

KEEPING CONCRETE ROADS FROM CRACKING

Flat sheets of heavy steel fabric are now imbedded in the most improved types of concrete roads to increase their The state highway departments of both New York and Pennsylvania have been so thoroughly convinced of the value of the innovation that hereafter the flat reinforcements will be specified in all contracts let by them. Of even greater significance is the use of a contraction joint in the center of the road, which overcomes cracking that has been hard to prevent hitherto. A dowel-type contraction joint forms a plane of weakness directly across the road. The slight contraction which takes place, instead of forming cracks like those of a drying mud puddle, will be effective at this plane of weakness. A fine hair crack is caused which is not nicked by the traffic.

WINDSHIELD AND SPOTLIGHTS
FITTED TO A MOTORCYCLE

After cutting down the frame of a standard automobile windshield, and reglazing it, the owner of a motorcycle mounted it on the handlebar of his machine, behind the headlight. Con-

nected to it are standard windshield spotlights, and the whole forms a very unusual equipment for a motorcycle. The windshield is adjustable, and the

spotlights can be operated in the manner that is common on automobiles, but very unusual on motorcycles.

NEW INSTRUMENT RECORDS
AIRPLANE STRESSES

Not long ago the National Advisory Committee for Aeronautics undertook to obtain information about the stresses that are produced in maneuvering an airplane. At the beginning of a series of experiments it was observed that, when the plane was flying a straight and level course, a spring balance with a onepound weight attached to it, would register just one pound. If the craft was put into a turn or made to rise, the apparent weight of the one-pound object increased to two or three pounds, while on a downward dip the spring balance arould indicate less than one pound or even zero. From these data it was calculated that a 180-pound person might exert a force equivalent to any value between zero and 800 pounds, toward setting up stresses in the craft during violent There is evidence of this in maneuvers. the experience of an airman being thrust down into his seat, during a tight spiral, with such force that it is almost impossible for him to regain a standing position, or even lift his feet from the floor.

Based upon the conclusions of these tests, an instrument, which has been called an "accelerometer," was designed, to detect and record the variations and relative magnitude of the forces that tend to set up stresses in an airplane structure when in flight. In doing this, it also gives an unbiased record of the relative ability of pilots in handling their machines in the air, and in making a satisfactory landing. In the accelerometer, a flat steel spring is fixed at one end, while the other end is free to be deflected by any force acting at right angles to the plane of the spring. This deflection is rieasured by a light tilting mirror, which owes its ability to rotate to the deflection of the spring, and thereby throws a beam

of light onto a moving film. The movement of the flat spring is damped by a thin aluminum vane attached to it and vibrated between the poles of an electromagnet. The degree of damping is controlled by varying the current through the magnet. The source of light is a lowvoltage tungsten lamp, similar to a flashlight bulb, an image of the filament of which is focused by reflection from the mirror onto the moving film. The film is driven at a constant speed by a governorcontrolled clock mechanism, which is provided with an electric brake for starting and stopping, controlled from a distance. The constancy of the clock was determined under conditions similar to flying and found to be within one per cent for carefully designed mechanisms. The natural period of the instrument is 70 vibrations per second, which is higher than any motor vibrations likely to occur, and eliminates any disturbances from that source. In mounting the accelerometer, it is placed within a few inches of the center of gravity of the plane, upon a sponge-rubber pad, to isolate it from vibrations of the fuselage. Two electric switches are provided for the convenience of the pilot in starting or stopping the clockwork and for turning the light on or off.

Tests with the accelerometer showed that whenever the wheels of the plane were clear of the ground, the entire craft had a constant vibration which was independent of the motor speed. It was also shown that excessive strain may be put upon an airplane structure by an unfavorable landing, and that running it needlessly along the ground, after landing, is likely to cause more vibration than the actual landing, especially 011 ground. On the other hand, the forces that are produced by accelerations arising from a spin are not great, unless the craft is made to dive precipitously,

This Bridge, of Cantilever Type, will Span the Hugli River between Calcutta and Howrah, India, and will Have a Span of More than 1,400 Feet, and a Width of 100 Feet. It will Take the Place of an Old Floating Bridge, the Location of Which is Indicated

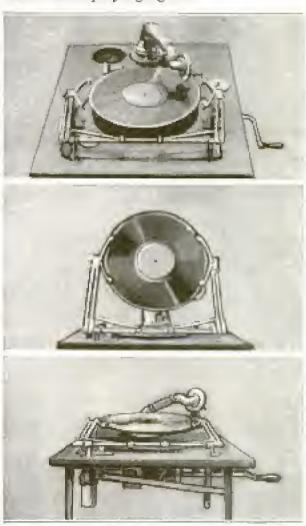

CANTILEVER BRIDGE TO SPAN HUGLI RIVER IN INDIA

At the present time, the only connection, by road, between Calcutta, India, and Howrah, on the opposite side of the Hugli River, is a pontoon bridge designed nearly half a century ago. Recent examination by a committee of engineers disclosed the fact that the entire structure was in extremely bad condition, and that, even with extensive repairs, it could be expected to last only a few years. It was, therefore, recommended that a new bridge of cantilever type be constructed some 600 feet upstream from the site of the present bridge. The span of the new bridge will be not less than 1,400 feet, with a width of 100 feet. Provision will be made for two railway tracks, sufficient space for six lines of vehicular traffic, and two 12-foot walks for pedestrians. It is estimated that the bridge will cost in the neighborhood of \$10,000,000 and take 31/2 years to build. 9

PHONOGRAPH RECORDS TURNED BY AUTOMATIC DEVICE

One can now place a record on his phonograph, start the machine going, and then sit down while it plays both sides of the record. When the needle reaches the innermost groove, a recently patented device raises the tone arm, swings it clear of the record, and turns the record over, laying it down on the turntable. At the same time the tone arm swings to the

outer edge of the record, and the instrument starts playing again,

Automobile Equipped with Radio-Receiving and Amplifying Apparatus, Which Recently Completed a Successful Overland Trip, Giving Out News and Concerts along the Way

radio news and concerts clearly audible a block away, is a rather stunning sight even in this day of the unusual. This has

been the experience of the people along the route of a specially equipped radio car that has recently completed an overland trip from Detroit to San Francisco in less than one month. In spite of apprehension as to the effect of vibrations in the automobile, it was found that the apparatus was able to pick up and hold broadcast messages and programs of any of the various wave lengths of the eastern sending stations, with perfect reproduction, whether the car was traveling fast or slow. There was apparently no damage to any of the delicate equipment, although steady and rapid driving was necessary throughout the trip to maintain a schedule prearranged to the minute. Supplies were carried in another car.

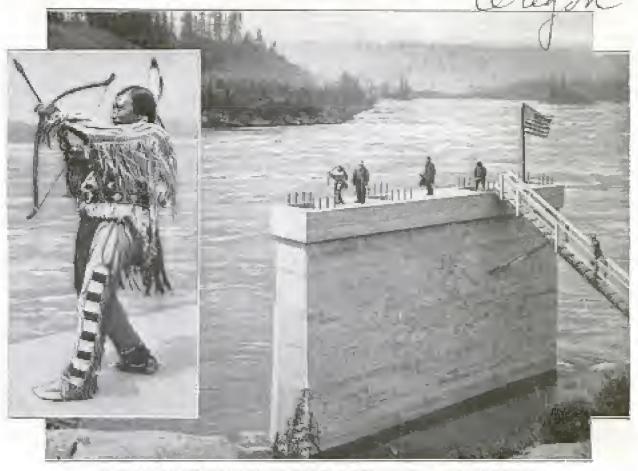

102 IMPROVED CONTINUOUS BOOK TRIMMER

An improved continuous book · and magazine trimmer has a new method of jogging piles of books and chucking them true with their bound edges for accurate and uniform trimming. This is done in a trough feed, the sides which are tapered so that the riles of books are automatically straightened as they are passed along from the wider to the narrower part of the trough, where it grips them. The pattern block that applies pressure to the pile of books, to hold it securely for cutting, is shaped to conform with the whole top surface of the pile, and is swiveled so that it applies a uniform pressure. The machine delivers the piles of trimmed books by belt conveyor, and all chips are removed by air suction.

INDIAN PARTICIPATES IN BRIDGE-DEDICATION CEREMONIES

DEDICATION ceremonies were held recently in connection with the modern steel structure that is being built across the Columbia River at the site of the legendary "Bridge of the Gods," as described in the June, 1922, issue of Popular Mechanics. A son of a Klickitat Indian chief took part in the ceremonies. He stood on one of the finished concrete piers, and shot across the river an arrow which was supposed to trace the exact course of the legendary bridge, now being replaced by the modern steel span. Construction of the bridge was begun on February 2. of this year, and the engineers in charge of the work hope to have it finished by the fall of next year.

GAS HOLDER EXPLODES, INJURING 100 PERSONS

Thousands of dollars of property damage and injuries to over 100 people, many of them serious, resulted from the terrific explosion of an illuminating - gas holder at Chicago a short time ago. Parts from the top of the tank were hurled high in the air as the enormous volume of gas hurst into a sheet of flame, sweeping over the roofs of houses and down upon the heads of pedestrians in near - by streets. This rare occur-rence in the gas industry is thought to have been caused by escaping gas that in some mysterious manner became ignited.

LANDING from the NON-STOP AIR EXPRESS

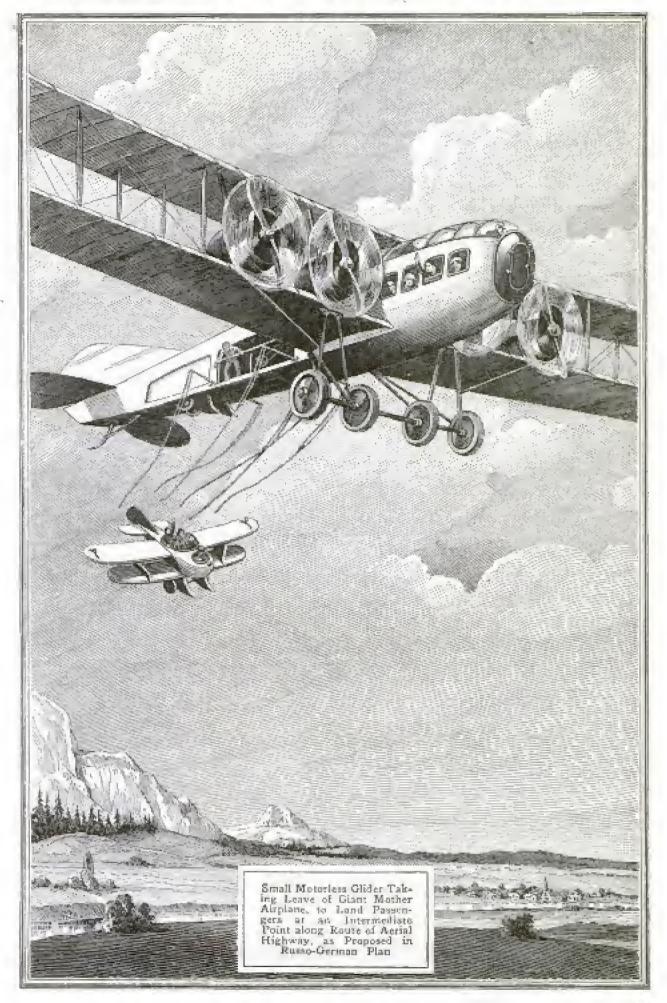

BY R. C. FOLGER

ONSIDER yourself aboard a giant CONSIDER yourself aboard a giant airplane whose whirring propellers rapidly drive from view faint objects on the earth far below. As towns and ham-lets recode in the distance you realize that you are fast approaching the one that is your destination, for the captain is giving orders to make ready for the discharge of passengers at one of the intermediate points along the route of the great air liner. The crew unfold from the capacious hold a small air boat, and lower it dangling from the huge hull by its special tackle. You and several fellow passengers climb down into the seats behind the pilot and buckle yourselves in as the big ship slows its engines to enable the little wings to catch the air. With a quick movement of a lever your steersman unleashes the small craft, which be-gins its motorless flight and gracefully glides downward to a safe landing, while the mother plane speeds out of sight.

Jules Verne's imaginary voyage in "1,000 Leagues under the Sea," we have seen so nearly realized in the exploits of the submarine of today, that it is not too far a stretch to consider possible air travel as announced by a German-Russian combine, which plans an organization for connecting the 5,000 miles over the steppes of Russia and the frozen wastes of Siberia, between Moscow and Vladivostok, with a service similar to the one depicted. Even now, large high-powered airplanes of all-metal construction are being built under contract to carry as

many as 100 passengers for 1,000 miles or more without stopping, and in the recent feats with gliders it is not impossible to see their adaptation to this use.

After the war, the Germans turned to motorless planes as a means of improving their planes to be motored with limited power, and Americans interested in flying, as well as some men in other countries, also began the construction of gliders. In June, a young American experimenter, flying in a plane of his own design, made a series of successful These attempts to fly with moflights. toriess planes have generally been looked upon as a source of amusement that would appeal to the sporting instincts of many young men, or at most as a source of data leading to more efficient designs of motored airplanes. An international glider contest was held in France this summer in which there were entrants from many nations, and it was thought that great strides had been made. Only a few days later, however, a former German military airman, flying at a meet in the Rhine valley, eclipsed all former records for motorless flying, by making a sustained flight of over two hours in which he rose to a height of 3,000 feet and landed six miles from his starting Fokker, the famous Dutch airpoint, plane designer, has since added another record to motorless aviation by remaining in the air 13 minutes with a passenger, and maneuvering his glider like a power-driven plane.

TOOL-CARRYING ATTACHMENT FOR USE OF CARPENTERS

To be attached to the overalls, or to a belt, a tool-carrying device has been developed by a Seattle carpenter. It is

Left: Tool Carrier Attached to Overalls, Method of Releasing the Tool from the

designed for a hammer, hatchet, or similar tool. It has two metal lugs which are caused to grasp the tool handle by the action of a spring latch operated by the weight of the tool. The hammer is grasped by the head and dropped, handle downward, between two protruding shoulders. In releasing it, the tool is grasped by the forefinger and thumb, while the palm of the hand is pressed against the protruding latch.

MECHANICAL DEVICE PASSES RIVETS AUTOMATICALLY

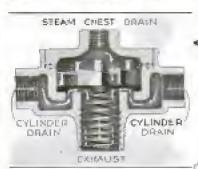

A pair of tongs in the hands of a skillful heater and an empty tomato can on the receiving end, has so long been the means of relaying hot rivets to the man

with the hammer, that it is interesting to know about a mechanical gun that does this automatically. The red-hot rivet is placed by the heater in a suitable cavity at the head of the gun, from which it drops by its own weight, through a downward-opening valve, into a small chamber, the valve automatically closing behind it. Pressure on a treadle admits air into the chamber behind the rivet, which is forced out and into a length of flexible tubing ending in a suitable receiver, from which the rivet is easily extracted. It is claimed the standard machine can delivere rivets 125 feet and as fast as they can be

DRAIN AND RELIEF VALVE FOR STEAM CYLINDERS

For use on any reciprocating steamoperated equipment as a means of drain-

ing condensation from the cylinders and steam chest, a relief valve that is selfopening and self-closing has recently been placed on the market. It is of the

disk-valve type, and an adjustable spring raises the disk from its seat automatically when the engine is at rest, thereby permitting water to escape through by-passes to the waste pipe. When the engine is running, the disk is scated by the pressure in the steam chest, and any excessive pressure at one end of the cylinder will overbalance the steam-chest pressure, relieving this excessive pressure and also permitting water to escape from the other end of the cylinder.

Ski Slide at the University of Wisconsin That was Designed Mathematically to Make Possible a Leap of 115
Feet: Inset Shows the Profile of the Ski Slide Drawn to the Scale Given Below. The DotOADU ted Line Shows the Path of the Skis of a Jumper with a Fall of 58 Feet Feet:

OF MECHANICS APPLIED IN SKI-SLIDE DESIGN

In direct contrast to the old Norwegian practice of having the country's most experienced skier "guess" the best design for a contemplated ski slide, students at the University of Wisconsin determined the profile of their ideal slide mathematically. The topography of the hill was obtained with surveying instruments, and drawing instruments and calculations did the rest.

The "take-off" point, from which the leap into the air is made, was located on paper by moving the jumper's trajectory into the position which gave the maximum leap, the length of which is measured in the air from the take-off to the place where the jumper's feet resume con-tact with the snow. To determine the trajectory, the principle of the motion of a projectile was applied, approximations heing made for the vertical jump of the rider and of his air resistance.

Actual results the past winter did not reach the theoretical, although it is thought that ideal snow and wind conditions will make the estimated leap of 115 feet possible. Thus far the longest jump for the hill is 103 feet, and it was made by the national amateur champion. The estimated speeds of 30 miles an hour at the take-off, and 50 miles at the foot of the hill, were undoubtedly reached, for they are calculated with ample allowance for To watch the air and snow friction. jumpers, one would think they were in the air almost a dozen seconds, but calculations show the period to be only $2\frac{1}{4}$

Falling from a height of 58 feet without injury is possible because the landing surface is not hit squarely. Only a glancing contact is made with the snow, owing to the steep slope of the hill. Although 50 jumpers participated in the one meet held last winter, none sustained any injury worth mentioning.

(In order to show to as many farmers as possible a system of crop rotation adapted to their needs, the agent of Thayer County, Nebraska, laid off at the county fair, on a patch of ground 7 feet square, a miniature farm divided into fields proportionately. Corn, oats, and wheat were sown in time to be in full growth when the fair opened, imitation orchards were planted around miniature farm buildings, and everything was in shape for giving practical demonstrations

of the rotation system.

chine shop or garage, are now available. The lamp is particularly adapted for making repairs on, in, and under an automobile, or around lathes, drill presses, etc., where delicate work is being done. The novelty is also manufactured as a wall or ceiling fixture and, owing to its extreme flexibility, the light can always be thrown exactly where it is wanted, thereby increasing the workman's efficiency.

ODD APPEARING PROTECTION

Protecting gasoline tanks from the intense rays of the tropical sun in the Panama Canal Zone, and thereby reducing evaporation, is accomplished in an odd but effective manner. The tanks are set in depressions, as is common with these containers, and have the usual encircling dike. Around the sides of the tank are placed three corrugated-iron "petticoats," each of which overlaps the one beneath, while on the top is a corrugated asbestos "hood," that in turn is surmounted by a "monitor," or cap, of the same material, the whole presenting a strange sight.

FLOODLIGHTS ON TRAINS

BY H. A. LANE

BRILLIANT night illumination of its picturesque transcontinental route, is the plan contemplated by a large railroad system in this country. The idea, as conceived at present, is to equip the observation coaches of its fast limited trains with a battery of powerful floodlights. These lights would be arranged to cover a range of approximately 160 degrees, with sufficient height and depth to illuminate the cañons, rivers, lakes, and mountains in the vicinity of the right of way, as the train rushes on through the night. Power for operating the lamps would be furnished by the axle-driven generators with which railroad cars are now commonly equipped, and which ordinarily are never used to their full capacity.

servation car, certain officials have suggested the advisability of placing them along the full length of the train. Also, further to enhance the effect, it has been proposed to employ lamps, or reflectors of various colors, which would undoubtedly yield fairylike scenes, particularly when directed upon snow-covered surfaces. Railroad men in authority have nothing but praise for the scheme, and while eagerly awaiting the completion of the floodlighting equipment, pointed out the fact that there is an additional and practical value of the brilliant lights as a protection against rear-end collisions.

// INTERNATIONAL BALLOON RACE ENDS IN DOUBT

Nineteen balloons, representing seven different nations, started from Geneva, Switzerland, in the eleventh Gordon Bennett Air Derby, which took place this summer. The start was made under very propitious weather conditions and was witnessed by an enormous crowd which greeted with enthusiastic cheers the first American balloon to take the air. Decision as to whether the winner was Captain Honeywell, pilot of one of the American balloons, or Lieutenant de Muyter, the Belgian halloonist, was complicated by the reported escape of the latter's balloon some hours after he had effected a satisfactory landing, and remained unsettled when this magazine went to press.

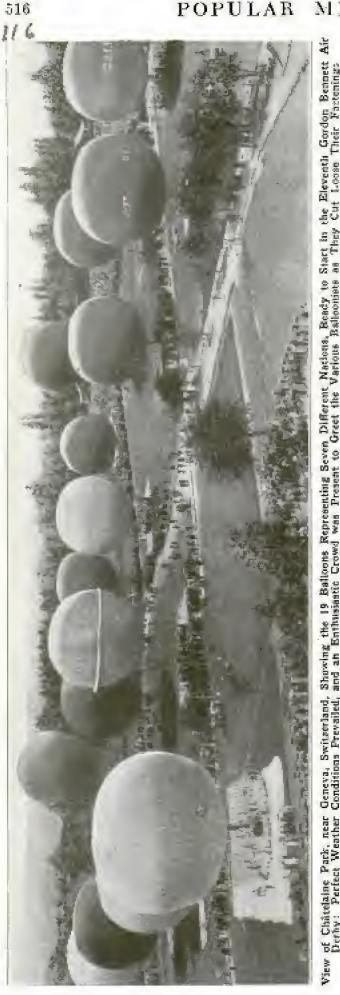

AMERICAN AIRPLANES FASTEST IN WORLD

Realizing that the fast pursuit plane controls the air in time of war, the U. S. Army Air Service concentrated its efforts upon this type several months ago, and called for the construction of planes that would be speedier than others in the world, Recently four distinctly different models were delivered, all of which have a speed of over 200 miles per hour. One is of all-metal construction; one has its radiators built into the wings; one has a folding chassis, thus reducing wind resistance, and one has its wings under the fuselage, and open landing gear with no axles. The new landing device that replaces the rubber-tired wheels with skids similar to sleigh runners, except that they are fitted with shock absorbers, makes it possible to band and stop in a distance of 125 feet, and also permits landing on water.

BEAUTIFUL CHURCH BUILT 9952 AT SMALL COST Time

Although built without architectural drawing or specifications of any kind, a small church recently dedicated in a western state, presents an appearance of beauty. The structure, named "Bethany Temple," was crected for a Protestant body, solely

GEORGE WASHINGTON MASONIC NATIONAL MEMORIAL

A NATIONAL membrial to George Washington, the man and Mason. will be crected on a commanding ridge at Alexandria, Va., on the road to Mount Vernon, and six miles from Washington, D. C., where it will be plainly visible. Its form is inspired by the ancient watch

towers of Greece and Rome, by the light of whose burning flares the mariner steered through the harbor entrance, emblematic of the guiding spirit of Wash-ington to our "Ship of State."

Resting on the topmost of seven artistic terraces, approached by broad walks and stone steps, the tower will rise 200 feet above its base to a view of all the surrounding country in which Washington spent so great a part of his life. The dimensions of the ground floor will be 160 feet wide by 230 feet deep, in the center of which will be a great room 70 feet wide by 100 feet deep and rising by a elerestory to a height of 64 feet to form the memorial hall. In an arched recess of the memorial hall, an imposing statue of George Washington will be placed. The second story, 50 by 75 feet, will be

devoted to the George Washington Masonic Memorial Museum, where will be located the interesting relics connected with Washington's service as master of the Alexandria-Washington lodge, as well as many personal relies of Washington, Among these are the Masonic apron he wore at the laying of the cornerstone of the national capitol at Washington, D. C., and also the silver trowel he used at that time; the old Chippendale chair occupied by Washington as master of the lodge, and a fine picture of General Washington, by Williams. The third level will be for future assignment, and the fourth will be a covered observation platform. The memorial and grounds will represent an estimated outlay of more than \$2,000,000. and it is expected the official ground breaking will be done this fall, as the contract for the excavation and foundations has already been let.

The movement for the memorial was formally initiated on Feb. 22, 1911, when the first regular meeting of the George Washington Masonic National Memorial Association was held at Alexandria-

SCIENTIFIC SEESAW FOR STUDY OF SEASICKNESS

With the object of finding a cure for seasickness, an instrument has been de-

vised at the instance of a French biological society for use in the study of the effects of rhythmic oscillations upon animals. The apparatus is composed of a board, 10 feet long and 16 inches wide, at each end of which is fastened a cage of the kind commonly used in laboratories. A 1/2-horsepower motor oscillates this board with movements corresponding to the pitching and rolling of a vessel at sea. These oscillations are controlled by a rheostat. Rabbits, chickens, guinea pigs, and pigeons have never shown any signs of suffering even after six hours in the moving apparatus. With dogs it was different, at least 30 per cent showing all the symptoms of seasickness. Experimental preventives being tested, and it is believed that ultimately a cure for seasickness will be discovered.

Apparatus for Making Animals Seasick: The Motor Imparts to the Caged Animals at the Ends of the Oscillating Board a Movement the Same as the Pitching and Rolling of a Ship

A PROPERLING RUDDER NEW TYPE PE

FOR SMALL BOATS

45

A new idea has appeared in the shape of a propelling rudder, for use in connection with small boats instead of pars.

Above: Lever Which Actuates Propelling Rudder, Operated from Stern Seat, Below: Rudder Closed for Steering Only, and Open for Propelling

With this attachment one can sit facing forward in the boat, and simply move a lever back and forth. The lever is attached to the yoke or top pin of the rudder, which is caused to weave from side to side like the fin of a fish so as to propel the boat forward.

NEW TYPE PERMITS SIGHTLESS AND SEEING TO CORRESPOND

A new type system, developed in France, which serves as a medium of correspondence between the blind and those who see, follows very closely the form and characters of the Roman alphabet, except that the letters consist of a series of dots instead of full lines. The idea is to supplement rather than replace the Braille system of printing for the blind, and it has the approval of the Interallied Congress of Mutilated.

ROUND-THE-WORLD FLIERS //5 HALTED IN INDIA

Recent reports of the airmen who set out from England on May 24, this year, in an attempt to encircle the globe in an airplane, indicated they had been lost in the wilds of India, but it has since developed they were forced to land because of engine trouble. Previously the flight had been temporarily halted at Karachi, India, owing to illness of Major Blake, the leader of the expedition, who was forced to abandon the attempt and turn it over to Captain MacMillan. The plans are to fly from India by way of Burma, Japan, and the Aleutian Islands to the Alaskan peninsula and thence down the coast to Vancouver. From there the airmen intend to fly to Halifax, where they will transfer to a flying boat and cross the Atlantic by a route to be determined according to the season,

TRACTOR PROPELLED BY FEET FOR USE ON SOFT GROUND

1800 1200 16

An agricultural tractor which is propelled by feet instead of by a wheel has been constructed in France. The purpose of the machine is to furnish a tractor that will operate equally well at all times on ground too soft or muddy for the effective use of propelling wheels. Mounted on a pair of steering wheels is a hood, with a radiator and power plant of automobile type. The sides and chassis of the hood are extended to the rear, and support two pivoted vertical levers, at the lower ends of which, in contact with the ground, are flat, horizontal propelling plates, or feet. By means of a system of connecting rods and cranks in connection with the motor, these levers are caused to move backward and forward alternately like the legs of any biped, and the propulsion of one foot continues until propulsion is started by the other. From the extreme rear of the machine. where there is a seat, the driver steers it, and at the same time overlooks the plow or other implement that may be hauled either by attaching it to the side or to the rear of the tractor. A (Suce) II.

NEW SWEDISH RADIO STATION

Gradually the entire world is being equipped for radio intercommunication. The latest development in this connection is the award by the Swedish government of a contract to an American corporation for the erection of a new radio station

near Gothenburg, on the west coast of Sweden, which will establish direct radio connection between that country and the United States. The contract calls for the installation of two 200-kilowatt alternator equipments, which will each deliver to the multiple-tuned aerial a current of 600 amperes. The entire plant will cost about \$2,000,000, and will be very efficiently equipped.

DENTAL LIP PROTECTOR AIDS OPERATOR AND PATIENT

Specially adapted for use in all dental operations wherein it becomes necessary

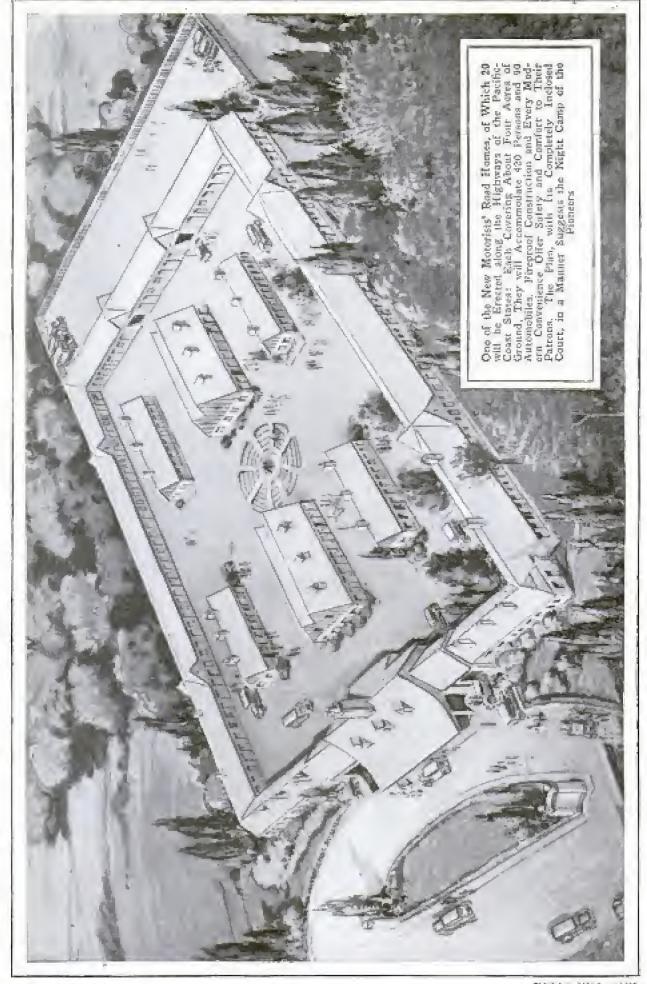

to distend and hold the corners of the mouth by means of a mouth mirror, a new device of this nature, which is also a lip protector, is held in place without any in dependent attachment. It is so shaped that it protects the inside of the cheek, and

adds convenience to the dentist and comfort to the patient. It can easily be cleaned and rendered aseptice.

MOTORISTS' CARAVANSARY IS NEW INDUSTRY

O NE of the most interesting developments of modern times has been the automobile-tourist movement. Owing to the improvement of highways connecting East and West, North and South, the wide range of utility of the motor car, and the average American's love for the outdoors—adventure—hundreds of thousands of persons this year have, with comfort, spent the summer traveling about the United States in automobiles.

The motor tourist who spends months on the road, aimlessly covering thousands of miles, rubbing up against nature in the modern equivalent of pioneering, is a peculiarly American product. He is not migrating, he does not travel from the urge of "green fields far away," because he is not going anywhere in particular. He is not dissatisfied, restless. Most of the motor tourists are successful business men per-manently located in the larger cities. They simply decide to take a long vacation, load the family into the automobile, and "hit the open road." Their prototype was the pioneer who crossed the plains in the days of the early Westthey are pioneers in spirit if not in purpose.

In early days the stagecoach, the pony express, and the tavern or roadhouse were the vehicles and centers of progress and civilized activities. People congregated at the taverns to meet the traveler—their point of contact with the outside world. With the

coming of the railroads this interest swung to the depots and hotel lobbies, bringing about the building of the present type of hotel. The automobile, and the coördinate stupendous highway development, in a few brief years have swung the pendulum back to the highways. Railroads are acutely feeling the change. Stage depots are appearing in almost every city, and the center of activity has shifted from the train depot to the motor station on the thoroughfares where auto busses roar up and away, full

of twentieth-century pep and efficiency. Motor touring in recent years has increased about 50 per cent annually. Of the vast number of automobile tourists, many thousands are accustomed to the modern facilities and comforts of the city. The call of adventure is strong, but they cannot east off their familiar environment overnight. It is they who fill the tourist camps provided by cities and towns along the highways of the coun-

try, where electric lights, fuel, water, and food can(be purchased, and shelters and entertainment are also

provided.

The latest development in providing attractive facilities for motor tourists is the "rodome," or huge tavern, 20 of which are to be built along the Pacific coast within the next few months. Construction of the first rodome, located at Sacramento, Calif., has already begun. The other 19 will extend from San Diego, Calif., to Vancouver, B. C.

The rodome accommodates 420 persons and 90 🔫 automobiles. It covers a tract of four acres. It offers a night-stopping place . where travelers are socially and safely comfortable. It has such advantages as absolute privacy, fireproof building, reasonably priced accommoda- 🝆 tions, completely furnished apartments containing water, light, gas, with bath, toilet, and lavatory in every suite; garage adjoining each apartment, delicatessen and store carrying groceries, meats, vegetables, dairy

products, newspapers and periodicals, ice cream, tobaccos, and auto accessories; complete auto-service station, community camp fire where travelers can meet and exchange experiences of the road, radio station, wash racks and pits for cleaning cars, and a staff of auto mechanics. Rooms are in singles, doubles, or suites; clean comfortable beds are provided with daily change of linen. Tenants may have a kitchenette or obtain their meals at a cafeteria. Clothing will be laundered for them, or they may launder their own.

Map Showing Location of "Rodome" Stations, and Automobile Boutes, along Pacific-Coast Unit of New Travel System

GOLF-STROKE COUNTER WORN ON THE PLAYER'S WRIST

An instrument designed to keep an accurate account of the strokes made he-

tween holes, and worn like a wrist watch, is a novel appliance for the golf enthusiast. On the dial of the instrument is a small pointwhich is 2.9

moved after each stroke, and at each number makes an audible click indicating that the count is made. Its use is said to become quite automatic after the first round or two.

MONSTER MICROSCOPE TO AID IN DETECTING CRIMINALS

In order to facilitate investigations in sconnection with the identification

criminals, a western eriminologist has had ♦ built a large highpowered microscope. Possessing all the features and detail of the smaller instrument, as a well as some additional adjustments, this special microscope has a number of distinct adavantages in studying Singer prints, bloodstains, hairs and fibers, Abullets, handwriting specimens, and other clews such as are used in the scientific detection of criminals.

One of the main features is the 10-inchdiameter eyepiece which permits five persons to Sview the specimen at the same time, This field of vision, combined with the unusual range and degree of magnification, which can be varied from two to

5,000 diameters, makes it possible to examine several objects in minute detail simultaneously. For instance, the similarity of two rifle bullets can be determined in a manner heretofore not available. In keeping with the general design

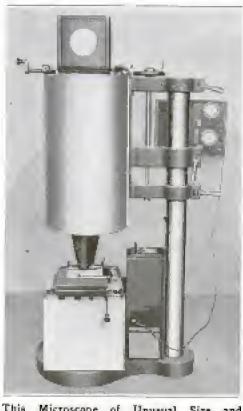

are the arrangements provided for holding and manipulating the specimen. With a field, 18 inches square on the main stage, the object can be inspected over that area without having to shift its position on the stage, which can be moved in three directions by micrometer adjustments. As the stage and substage are some distance from the operator, these movements are regulated by controls conveniently located at the top of the barrel and connected to the mechanism of the stage by flexible shafting. means of cross hairs in the tube, having a micrometer adjustment, together with the divisions on the operating controls, points on the specimen can be definitely located and noted. A finely graduated transparent scale at the eyepiece enables the observer to obtain any dimensions on the specimen. One-tenth of a turn on the most delicate control moves the specimen .0001 inch, which on the highest magnifications corresponds to a ½-inch movement of the image at the eyepiece.

Supplementary features of the design are the arrangements made for illuminat-

ing the specimen. Underneath the substage is a box containing a 1.000-watt nitrogenfilled bulb with two 5inch lenses for concentrating the light upon an opaque object, with which is also used a plate-glass reflector set at a 45° angle at the other end of the tube. for throwing the light back to the upper side of the object, For transparent specimens a special lens is used below the substage, the reflector being omitted. The attachment of a vertical projector above the eyepiece makes it possible for an assembly within a radius of 40 feet, to obtain a view of the enlarged image of a microphotographic

The minimizing of

specimen. vibration due to the instrument's weight of 525 pounds, is an added advantage. Some idea of its size can be realized from the principal dimensions, for the height is 6 feet 4 inches, length of barrel 34 inches, and circumference of barrel 54 inches.

This Microscope of Unusual Size and Power is Used in the Scientific Detection of Criminals

A SMALL flying boat, said to be the most efficient craft of its class yet evolved, represents the latest Gorman development in this field. It is a monoplane type with a sotary motor and is of all-metal construction. This is one of the evidences of the great activity of the Germans in aviation, and indicates they do not intend to drop behind the rest of the world in building up their flying industry.

9964 CONCRETE BRIDGE DEDICATED TO SERVICE MEN

"Victory Bridge." a heautiful concrete structure over the Chattahoochee River at the town hearing the same name, has lately been completed and formally dedicated to the soldiers and sailors of Florida, who served in the late World War. The bridge is constructed entirely of rein-

wheels, a design, called a backwater suppressor, has been developed to remove the high tail water, utilizing the waste water coming through the spillway of the dam for this purpose. In a properly built dam, the water flows over the downstream face in a thin sheet and leaves it at a high velocity, forming at some distance farther on a standing wave or backroll. This energy, heretofore wasted, has been directed toward removing the backwater from over the outlets of the water wheels.

In addition to the increased operating efficiency obtained, careful estimates have indicated that water-power plants designed on the backwater-suppressor principle, can be built at less cost than the conventional types now in use.

"IRONING DAY" A PLEASURE WITH ELECTRIC IRONER

"Ironing day," that day of drudgery for the housewife, can now be relegated to the past as far as the drudgery is concerned, if a recently introduced electric ironer is used. The appliance weighs only 65 pounds, occupies a space 3 feet long by 15 inches wide, irons everything in the family wash, and is so simple that

only as a readjustment of strains arising from a similar movement of the south cables in 1898, when trolley cars were

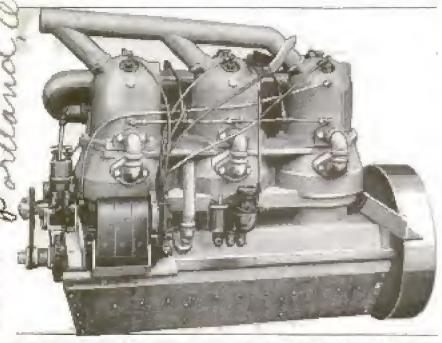

> first operated a cross the bridge. In addition to the rebuilding of this 40-yearold structure, plans are considered to span the river, near by, with a new bridge in order to meet the steadilyincreasing traffic demands at that point. Traffic diverted to the new bridge, when finished, will permit rebuilding the old, one.

TWO-CYCLE ENGINE WITH AUXILIARY CYLINDERS

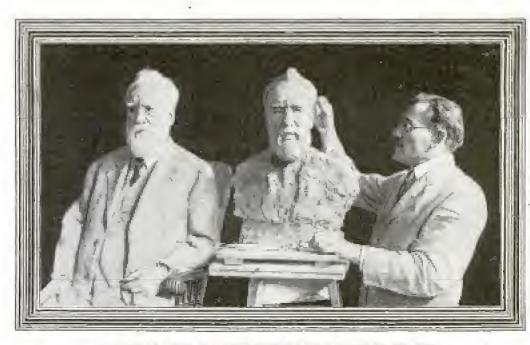

A two-cycle engine which has an auxiliary piston and cylinder in which the preliminary compression is done instead in the crankcase, has been demonstrated, it is said, with perfectly satis-

factory results in Portland, Ore. The auxiliary cylinder is connected to the lower end of an ordinary two-cycle cylinder, which for a considerable length below its intake and exhaust ports has its

wall finished inside to fit the two-cycle piston at the end of its outstroke, and outside to fit the auxiliary piston at the end of its instroke. This auxiliary piston, Ushaped in section, is . bored to fit this finished part of the two-cycle cylinder, and has its outside wall finished to fit the bore of the auxiliary. cylinder, leaving a concentric space between the piston and the auxiliary cylinder head, where the charge is sucked in and partially compressed. The power piston and its connecting rod drive the shaft with one crank, and two other cranks at 180° with suitable connecting rods operate the auxiliary piston.

New Type of Two-Cycle Engine Built with Three Cylinders for Automotive Work: Intake of the Charge and Preliminary Compression are Done in the Lewer Part of Each Double Cylinder, Which Work is Normally Per-Jormed in the Two-Cycle Crankcase

DEATH OF ALEXANDER GRAHAM BELL

AMONG stories of invention none is more romantic than that of the telephone and its creator, Alexander Graham Bell. Both his grandfather, in London, England, and his father, in Edinburgh, Scotland, were lifelong experts and teachers of the mechanism of speech, and in time this became a family profession. Alexander Graham himself, early in life, took up the study of vibrations. First later on came

the study of electricity, of which at that time he was entirely ignorant. He specially investigated Helmholtz's work in connection with the production of vowel sounds by electrically vibrated tuning forks. Later, after his arrival in America, he made a number of inventions based upon the utilization of

musical notes as telegraphic signals, and these led gradually to the perfecting of the telephone itself. This made him a world-wide celebrity. His bearded face became the subject of countless reproductions, none more faithful than in a bust for which he posed to the famous sculptor Moses Dykaar.

For many years the great inventor had made his summer home near the village of Baddeck, in

the village of Baddeck, in Nova Scotia. Here he died August 2, in his 76th year. Two days later he was buried, as simply and unceremoniously as he had lived, on the peak of the neighboring Beinn Bhreagh mountain, beneath a steel watch tower built there years ago by the inventor himself.

has made it possible for his patrons to have a clear passageway when mounting or leaving the stand. Only one of each pair of footrests swings, being supported by a bracket hinged to the other. The innovation is particularly pleasing to women because their skirts are less likely to be caught in one or the other of the footrests.

OREGON LUMBER CAMP BOASTS 1 LONGEST RADIO ANTENNA

What is claimed to be the longest privately owned straight-line radio antenna in the world has been erected at a lumber camp in the state of Oregon. When it was decided to install a radio outfit, all the available standing timber had been removed for some distance from around the camp site, and the nearest suitable tree stood 1,015 feet away, with its lowest branches 150 feet above the ground and its top 300 feet in the air. In spite of the apparent difficulty, the lumberjacks were undannted, and one of them volunteered to climb the tree, making fast, 200 feet above the ground, the end of the long copper wire that was stretched to the radio house. The climber wore scaling spurs and worked his way up, assisted by short ropes around the big trunk. This radio installation is said to be one of many that are now being put in at the large lumber camps of the Northwest, so that the hitherto isolated workers may have daily contact with the news and enjoy some of the entertainments of the outside world.

New Combined Passenger and Automobile Boat Put into Service as a Ferry between Detroit and Windsor: It Is 170 Feet Long, 66 Feet Wide, and Accommodates 2,000 Passengers and 60 Automobiles. It Is Also an Ice Breaker

PASSENGER AND AUTO FERRY ON THE DETROIT RIVER

To accommodate the heavy traffic between Detroit, Mich., and Windsor, Ont., a very large combined passenger and automobile ferry, named "La Salle," was put into service recently. The boat is 170 feet long, 66 feet wide, drawing 14 feet of water, with a net tonnage of 334. The automobile deck accommodates 60 cars lined up three abreast. One of the advantages of the boat is the short time it takes to bring aboard and unload the automobiles. The passenger capacity is 2,000. The big ferry is also an ice breaker, which is an unusual feature in a ferry of this Size.

DENTAL PLATE SUCTION VALVE FOR MAINTAINING VACUUM

Many persons who are forced to wear a set of artificial upper teeth know the annoyance caused by the plate not holding

Municipal Bathhouse at Salt Lake City, Which is Supplied with Natural Hot-Spring Water: It Contains
Locker and Dressing-Room Accommodations for Over 1,200 Persons, and Has a Completely
Equipped Modern Laundry for the Sterilization of Bathing Costumes

HOT-SPRING BATHHOUSE FOR SALT LAKE CITY

BY GEORGE F. PAUL, 900 Elepoor

SALT LAKE CITY has at last made a reality out of what for years was but a dream. Now the western city has a \$330,000 bathhouse, which will provide her own people and her visitors with natural hot-water bathing and swimming. It contains a magnificent common pool, 120 by 50 feet in dimensions, a medium-sized pool for private parties, seven small pools for individual use, and complete

ering plans for the building, decided upon a structure of the Spanish renaissance type, one that would have both airy grace and restful dignity. Furthermore, the building was constructed to make the best possible use of the natural hot waters. In 1920, there were 133,000 bathers at the old springs. It is believed that the annual attendance at the new bathhouse will reach the 300,000 mark.

Locker and dressing-room accommodations are provided for 440 men, 600 boys, 250 women, and 100 users of the private pools. There is a completely equipped laundry, which turns out 400 sterilized and dried suits every hour. It is believed that the institution will pay itself within years. The charges will probably be 25 cents for the main plunge, and 50 cents and \$1.00 for the individual pools.

Much has been done to provide for the comfort and convenience of the patrons. The southern part of the main floor is equipped with a three-chair barber shop, a massage room with Turkish baths, and a special room

Interior of Municipal Bathbouse, Showing the Main Swimming Pool, Which Is 120 Feet Long by 50 Feet Wide: There Are Also Several Smaller Pools

equipment for accommodating the patrons. The city commissioners, in consid-

The women patrons will find a beauty parlor, a restroom, and quarters for a masseuse. For emergency cases, a pulmotor and other resuscitation apparatus have been provided. A completely equipped café will furnish the food for those who take the baths under the direction of a physician.

The waters are limpid and smell strongly of sulphureted hydrogen, and issue from the mountainside in a strong stream, at a temperature of 95 to 104° F. The people of Salt Lake City look upon this new building as a health investment. They feel that it will also be an added attraction for visitors to their city.

GAS, OIL, AND AIR DELIVERED FROM HOUSE TO HOUSE

Delivering gasoline, oil, and air from door to door, is the latest activity of a filling station in Denver. Colo., and has proved very popular. The vehicle used for the work is equipped with a 750-gallon gasoline tank, a 60-gallon tank for lubricating oil, a heavy-duty air compressor with a tank having a capacity of 160 pounds, all of which are mounted on the chassis of a two-ton motor truck. A complete line of accessories for emergency needs is also carried, it being the owner's intention to travel a regular route over the adjacent highways, dispensing general "first aid" during the summer months, while in the winter, a house-to-house service will be maintained. Judging from the popularity gained by the service, it is probable that other trucks will be similarly equipped.

TOOL-HOLDING ATTACHMENT FOR GRINDING MACHINES

A new tool-holding attachment for use in connection with grinding machines is on the market. It may be built in as

STAR ISLAND DEDICATED EXCLUSIVELY TO RELIGION

STAR ISLAND, one of the Island Shoals, 10 miles off the mainland of New Hampshire, has been dedicated exclusively to teligious service for 120 years. On its rocky summit is a small gray-mone church which was built in the year 1800. This has been used ever since as a place of worship, first by fishermen's mothers, sinters, and sweethearts who prayed for the safe return of their loved ones. During the last 26 years, it has been a shrine for Unitarians and Congregationalists. At 10 o'clock each night, long lines of men, and women, carrying small lasterns, wend their way thither and, a churchful at a time, hang their lasterns on the walls, and bow their heads in prayer or take their voices in appropriate hymns,

AUTOMOBILE STOP SIGNAL ENTIRELY AUTOMATIC

An automobile stop signal has been devised that is absolutely automatic, being actuated exclusively by the effect of arrested momentum. The signal flashes, independently of anything else, by any slowing down of the car. The current is automatically cut off and the light disappears when the car comes to a stop, or at the instant it picks up speed or discontinues the slowing-down movement. In appearance and location at the rear of the car, it is much like any other stop signal, its novel use of the action of arrested momentum being its distinguishing feature. Being operated in this manner, it is exceptionally durable.

Set-Up of Electrical Apparatus and Camera for Photographing Flight of Bullet from Revolver, at the Rate of 92,000 Pictures per Second: Note Large Lens for Concentrating Light from the Spark on the Object

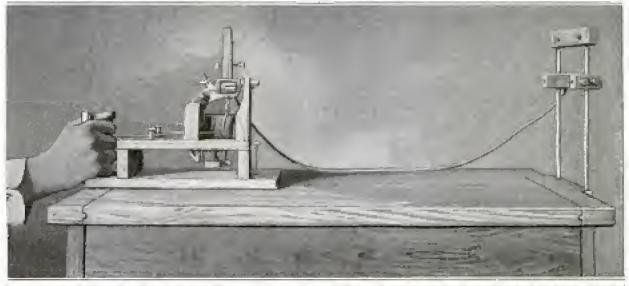

PICTURES AT THE RATE OF 92,000 PER SECOND

BY A. N. MIRZAOFF, 269 Lel

FROM an exposure lasting six minutes in the heat of a bright sun to taking pictures at the astonishing rate of 92,000 per second, is the record of 80 years of accomplishment in the science of photography. In considering this, it is interesting to trace some of the steps by which this development has come.

First, there was the clumsy tripod camera with its wet-process plates, simple lens, and crude shutter. Next came the dry plate, and a little later lenses and shutters capable of exposures of .04 second, making snapshots and the

hand camera possible. Further improvements in lenses, followed by the introduction of the focal-plane shutter and reflecting type of camera, gave exposures of .002 of a second, and, with some refinement, .001 of a second, of which there is evidence in the pictures, shown in the newspapers and on the screen, of athletes and race horses in action. Still faster speeds dictated the abandonment of the use of sunlight and the mechanical shutter with which it was controlled, and, as in many other instances, recourse was had in electricity. So the next high-

speed camera used a little spark of high actinic value, with a revolving film to produce 5,000 pictures per second. Except that the film is held stationary, this is the basis for the latest development.

The French scientist who has succeeded in making pictures at the rate of 92,000 in a second, secures the strip of film to the inner rim of a drum about 3

Electrical Equipment Used in Connection with the High-Speed Camera: The Induction Coil Which Raises the Voltage from 10 to 12,000 Volts Appears above the Three Condensers

feet in diameter, in the center of which is a prism mounted directly behind a highspeed lens. The prism is made to rotate so as to throw a beam of light, coming through the lens, successively on different points of the stationary film. The small motor mounted on the back of the camera, so as to turn the prism at 160 revolutions per second, also runs a commutator device that causes the sparks to be made in step with the turning of the prism. In order to produce sparks of high intensity at regular intervals of short duration, a high-frequency genera-

tor with a powerful induction coil and three condensers, is A large lens is made use of. made to focus the object to be photographed upon the lens of the camera, so as to obtain the maximum effect from the light value of the spark. It is arranged so that the action of the object to be photographed will control the starting and stopping of the camera, because the time required for the complete film of pictures is so small, when compared with the utmost rapidity of any human agency.

Photographing the flight of a bullet, and the wing motions of birds and flies, as well as other rapidly moving objects, and afterward studying these actions by slow-motion apparatus, is the interesting possibility this new camera suggests.

An enterprising manufacturer has developed a lead-welding outfit, similar to the apparatus used by lead burners, that is particularly adapted to the needs of storage-battery repairmen. It is supplied for use with oxygen in connection with hydrogen, acety-

lene, city or natural gas, whichever is most conveniently available, and is complete in all details, including an assortment of burner tips, hose, regulators, gauges, burner, and tank connectors.

300 FT. HIGHER THAN MINESHAFT

FOR OLD-MODEL AUTOS

An oil-pump drive, designed to replace the conventional oil-pump spring used in

some automobile motors, of models carlier than 1920. will automatically thaw out a frozen oil pump. The device is simply a friction clutch with a spring pressure on a fiber friction disk of special material, which is practically waterproof and a good conductor of heat. The pressure is sufficient

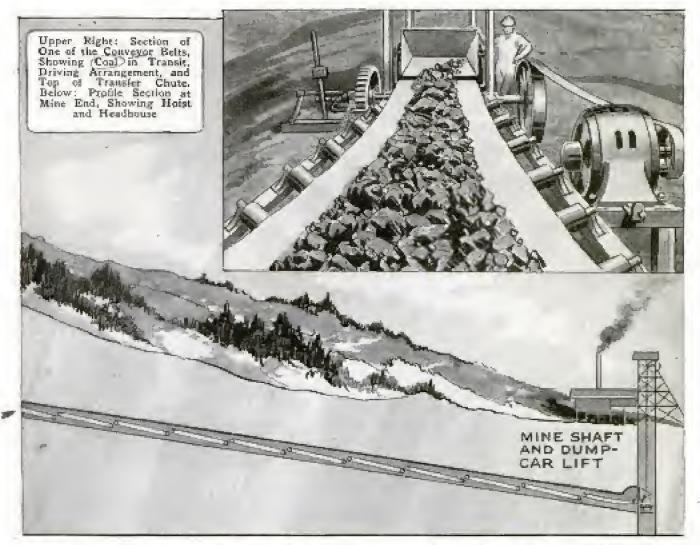

to drive the pump under normal conditions. When the pump is frozen the disk slips, creating enough heat by friction to thaw out the pump, after which the normal drive is resumed.

BELT TO CARRY MINE'S OUTPUT

THROUGH LONG TUNNEL

An eastern coal company, in opening up three new mines situated close together, was confronted with the problem of transporting the output to a river 41/4 miles away, with steep and rugged hills intervening. A railroad around the hills or one through them appeared to be too expensive in first cost and in operation, so it was decided to bore a small tunnel through the hills and convey the coal on a series of belts.

The distance of 41/4 miles, in which there is a rise of 300 feet, will be made with 20 conveyors in series, each delivering the coal to the one alread. At the loading end, the belt will be 5 feet wide for receiving the coal direct from the mine cars as they are hoisted up the shaft, and will carry the coal 1,500 feet to the next conveyor, which will be 4 feet wide. The unloading belt at the river will be 4 feet wide, and will deliver to four or six other belts, which discharge the coal through chutes into barges. The belt,

which will be made of a rubberized fabric, similar to automobile tires, nearly 1 inch thick, is estimated to have a capacity of 1,200 tons of coal per hour. It will run on low-friction troughing idlers.

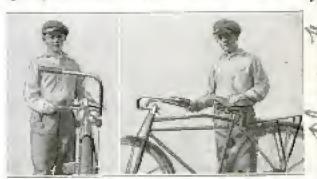

94 GOLF CHART IS PRIMER FOR BEGINNERS

A firm has put a new invention upon the market, which is a sort of primer for all golfers. By graphic, line-drawn penand-ink sketches all positions of hands and sticks are shown on a large folder. Every picture is numbered, there being 72 in all. The first one shows the position of the player's hands as it should be. Others show how to stand when putting, driving, or making other plays.

NEW ADJUSTABLE HANDLEBAR CONVENIENT TO CYCLISTS

A patent has been allowed on a new handlebar for bicycles, that permits horizontal rotary adjustment, making it possible to swing the bar readily from its

normal position to one at right angles to the frame, so that it can be used to support the bicycle against a building. There is an expanding handlebar stem surrounded by a collar with notches that engage a dog. The collar carries the handlebar extension which is adjusted, and held to the handlebar proper by a spring-actuated lock. No wrench is

A New Adjustable Handlebar for Bicycles, Which can be Turned, as Shown at the Left, So That the Cycle can be Rested Safely against a Wall

needed, as the dog can be operated and the sleeve adjusted with the thumb and forefinger.

STRETCHING OF STEEL CHAIN MAKES IT RIGID AS BAR

Steel chains are usually thought of as being flexible—just the reverse of a bar but one of these belonging to a large rail-

These Railroad Men are Holding a Steel Chain Which, after Using, was Found to Be Perfectly Rigid

road, recently underwent a curious transformation. The chain, which was 25 feet in length with ½-inch links, was used to pull a derailed car back on the tracks. The strain was so great that when the task was completed the links were found to have straightened out enough to lock them together, and the whole chain was as rigid as a solid bar of steel.

q006 ELECTRIC-DRIVE FERRYBOATS

First tried on warships, the so-called electric drive later was tried on some merchant vessels and has lately been applied to ferryboats. Such boats are now in operation in the East and on the Pa-

cific coast, and two new boats of this type are to be used by the Staten Island ferry service at New York City. They will cost about \$1,000,000 cach, and will be 218 feet long, with four driveways for autos and horse-drawn trucks on the lower deck, which will be open from the end to the side of the boat. A steel and concrete stairway at each side of either end of the boat will lead to the passenger deck.

The usual cabin seats will be installed on all sides of the boat, and to the rear a special line of seats for passengers who desire to smoke and at the same time be shielded from the wind. To a great extent the boat will be constructed of steel, with the four driveways entirely fire-proof. The four driveways themselves constitute a distinctly new feature.

Twin, independent screw propellers at each end of the boat, driven by electric motors with alternating current of 2,300 volts, and generated by a high-speed steam turbine, will be the power of propulsion.

COMBINED MULTIPLE-DRILLING AND TAPPING MACHINE

Designed for small work, a multiple-cardilling machine that can be instantly -

converted into a tapping machine has five adjustable spindles that may be used singly or collectively. Each spindle has a chuck for holding either a drill or a tap. The machine is driven by a 1/2horsepower motor, and by means of cone pulleys with a special adjustment for taking up the slack of the belts, speed changes of a wide range are made

quickly and easily. The spindles can be adjusted from a minimum center distance of $\frac{7}{8}$ inch to a maximum of $4\frac{1}{2}$ inches.

HOTEL MOVED TO NEW SITE, 120 FEET DISTANT

An eastern contractor recently completed the moving of a four-story hotel, weighing 60,000 tons, a distance of 120 feet. Jacks were placed

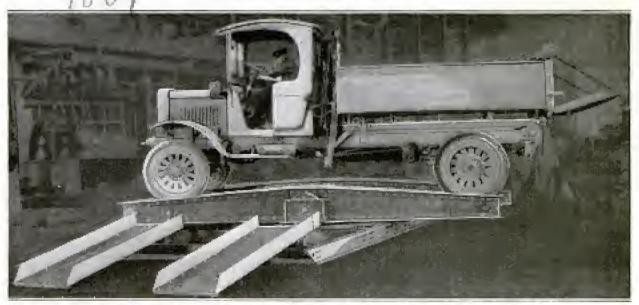

Upper Right: General View of Hotel Building in the Process of being Moved through City Street. Lower Left: Close-Up, Which Shows Timbering Necessary to Support Upper Ploors While Moving, Also Timbers and Rails along Which the Building was Pulled

every 4 feet under the building, and it was kept so level and the work was otherwise so well arranged, that a

capstan and a pair of horses were sufficient to do the moving. To add to the difficulties, the building had to be turned halfway around. This work occupied the greater part of two months and cost \$85,000. The outcome of this undertaking has been watched

with interest by con-struction men throughout the country, because of the size of the building and the distance moved.

TURNTABLE FOR MOTOR TRUCK SPEEDS ROAD CONSTRUCTION

This turntable has been designed for use in road-construction work and is expected by the producers to be a great saver of time, labor, and money. Where highways are being built, it is usually a difficult task to turn the large machines which haul the stone, sand, or other materials, and this necessitates considerable backing of the trucks to reach the desired points. With the use of the newly introduced turntable, any kind of motor-driven car can be turned by power derived from its own rear wheels, these running on a treadmill arrangement that revolves the table.

SPEED KILN-DRYING PROCESS AND IMPROVE LUMBER

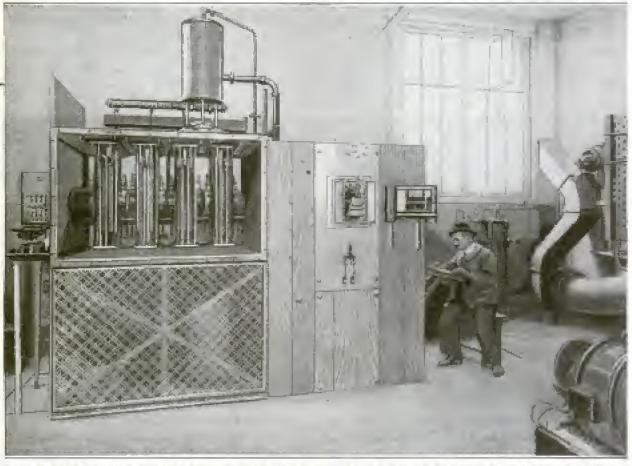

One of the Lumber-Drying Rooms: The Heated Ale Comes Upward from Radiators below the Floor, and the Fan at the Right Keeps It in Circulation

no information

In France, because of the need of speedy construction in the devastated regions, the older method of drying and seasoning lumber in the air has been found too slow for requirements. Now, however, a new process has been devised that makes it possible to kiln-dry lumber, ready for building construction, in a period of two days. The lumber is pited in a series of small buildings and heated air containing an excess of oxygen, or ozone, is circulated through them. This method not only speeds the drying process, but is very effective in killing the germs that infect the green lumber and are not always exterminated by ordinary kiln drying. As a result of this treatment, the building lumber is stronger and of better grade than that dried by the older and slower method.

(Scientists who have been conducting experiments in sterilizing milk, are of the opinion that they have discovered a method of destroying typhoid and tuberculosis germs. Fourteen thousand quarts of milk have been used in their work.

The Battery Room at the French Lumber-Drying Plant: The Apparatus Shown Is for Producing the Highly Oxygenized Air, or Ozone, Which is Later Heated. At the Right, above the Man's Head, Are Recording Instruments That Measure the Flow of Air on Its Passage to the Drying Rooms.

The Four Good-Sized Traveling Cases, Standing on the Ground at the Rear End of the Automobile, Fit Snugly late the Compartments Built under the Running Boards, There Being Duplicate Spaces on the Other Side of the Car

SPACE UNDER RUNNING BOARD USED FOR LUGGAGE

For the convenience of the motorist who uses his car to go on week-end jaunts or short trips, a body has been designed with luggage space under the running boards. There are two compartments on each side of the car, and neat cases fit snugly in these spaces. The construction of the running boards is such that the cases are protected from rain or mud. These running boards do not detract from the appearance of the car.

concrete Bridge Arches Built by New Method

In order to prevent the deflection of steel ribs when used in the construction

of reinforced - concrete bridge arches, a method of bracing them with cables has been employed in Europe. Self-supporting arch ribs of standard steel shapes are set up and are kept rigid by ties connected to them from below and suspension cables from above. This allows them to be used for the support of the forms, without the necessity for any centering, and without deflection while the concrete is being poured .On account Eng Section

of their rigidity, the setting of the concrete is not interfered with by movements of the ribs. When the concrete has set, the ties and cables are removed.

763 TREE KILLS HORSE

In a storm that swept Manila not long ago, the wind reached a velocity of 90 miles an hour, and numerous vessels were wrecked, buildings were demolished, and practically every tree in the city was laid low. A curious incident of the storm was the almost miraculous escape from death of a native cab driver. Hurrying along a country road seeking shelter, his cab was hit by a falling tree and smashed. The horse was instantly killed, but the driver escaped without a scratch.

Although His Horse was Instantly Killed, the Driver of This Cab Escaped without a Scratch in a Recent Great Storm in Manila When the Large Tree, Fell across His Vehicle as Seen Here

278 Ultroil DUS FITTED NEW DOUBLE-ACTING ENGINES

Improved tops built over the seats of the upper deck are being adopted by a Detroit bus line. A light wooden frame

WITH UNIQUE TOP PIECE

The Top Built over the Seats of the Upper Deck on the Bus Is an Innovation in Motor-Bus Equipment. There Is No Covering over the Aisle; Strips Similar to Auto Curtains Inclose the Sides in Rough Weather

supports the roofing. There is no covering for the aisle nor is the air shut off by bulky window cases. In disagreeable weather, the sides are inclosed by strips similar to auto curtains.

NEW DOUBLE-ACTING ENGINES

Double-acting marine engines of a modified Diesel type are being developed with great success in England. After a

of experimental Series investigations completed with the first models built, it has been decided to construct a three-cylinder engine of the same type, designed to develop 2,000 brake horsepower. At 100 revolutions per minute, this will be done with cylinders of 241/2-inch bore, and 44-inch stroke - exceedingly small as compared with anything like the same power in singleacting cylinders. It will be a remarkable achievement in other ways, for the largest power that hitherto has been developed in commercial marine Diesel engines is about 650 brake horse-

Rough Weather power per cylinder, so that the double-acting type even at this early stage of development represents an advance on existing practice. Its weight will be only about one-half that of a corresponding single-acting motor.

CRUISE OF THE GREAT LAKES IN OPEN ROWBOAT

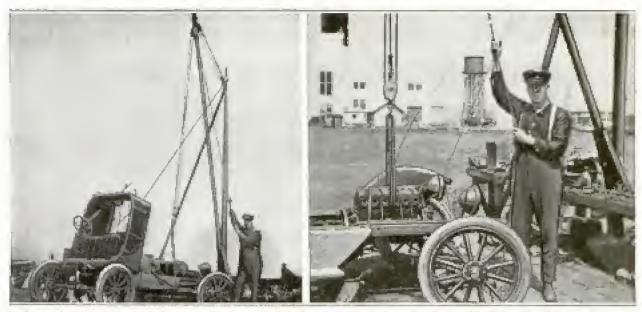

In a 16-foot combined motor and rowboat two young adventurers from Detroit have recently started on a 4,000mile cruise around the

Great Lakes. Their des-tination is Duluth, via the American shore of Lake Huron, St. Mary's Xiver to Lake Superior, and thence along the shores of Michigan and ·Wisconsin. They will return to Detroit the same way. The boat is fitted with a 21/2-horsepower chmarine engine, which in ordinary weather and Smooth water propels Othe boat at a speed of between 7 and 8 miles an hour, Oars are provided to help handle the boat in bad weather.

Navigation papers were taken out at Detroit, and the boat is outfitted to comply with the navigation laws,

YACHT'S RIGGING UTILIZED 4302IN AUTOMOBILE WORK

A resident of California, who is both a yachtsman and an automobile dealer, has taken advantage of this combination of occupations by using the mast of his yacht, with its boom and tackle, to help him dismantle his motor cars. He removes this rigging from his yacht, and sets it up near a workbench on shore. The boom is 35 feet long, and can be swung in any direction so that the tackle, dangling from the end of it, will reach an automobile from which the engine or other part has to be removed, and placed upon the workbench for repairs. The guys that brace the mast are detachable, and can be moved as needed to make way for the boom.

HISTORIC DELAWARE CROSSING 25 TO BE MEMORIALIZED

It is planned to have a national park at the site where Washington made his strategic crossing of the Delaware, with highways marking the routes of the colonial forces, a memorial bridge having a section devoted to each of the 13 original colonies, and a monument of Washington actually crossing the river, erected in midstream, as the main features. Monuments to patriotic and illustrious Americans, as well as historic memorials by the various states and organizations, are a part of the plan to make the proposed park a great center of patriotic devotion. The park will be on both sides of the river.

DIVERS WORK IN CAVITIES OF BIG CONCRETE PILES

Most people nowadays know what a concrete pile is, but several hundred concrete piles extraordinary are being used in the construction of a new government pier at Vancouver, B. C. They are 7 feet in diameter, and because each pile is being driven right down through the mud to bedrock, any one of them

may be well over 100 feet in length before it is com-

pleted.

For convenience of construction, these mammoth piles are made in sections, about 10 feet in length, and are hollow, the inner space being about 5 feet in diameter. This space is filled up with concrete as soon as the shell is down to the rock bottom. The hollow space makes it possible for divers to inspect the bottom, inside the shell, during the driving, and also makes it easy to dispose

of the large amount of earth which is necessarily displaced when so large a cylinder is forced into the harbor bottom. This material—mostly mud and saud—is lifted out by an orange-peel bucket, which removes from a quarter to a half cubic

yard at each lift.

As the material is taken out of the center in this manner, the great pile sinks by its own weight, aided by enormously heavy cast-iron rings, which are laid on top of all as additional ballast. But sometimes even this is not enough, and recourse is had to powerful jets of water, directed against the sand or gravel around the bottom edge of the pile. This operation was in progress when the accompanying photograph was taken, and

it shows that the water inside the cylinder has risen to about 15 feet above the level of the water in the harbor, owing to the volume discharged by the powerful pumps used for the "jetting" operation.

In this particular instance, a peculiar accident had occurred just before the picture was taken, and the diver shown sitting in a sling just above the central opening had just returned from a trip to the bottom to investigate the occurrence.

Everything had been taking its merged

Diver Returning from Inspection Trip to Bottom of Huge Concrete Pile, Nearly 100 Feet below Surface of Harbor: The Water Pouring Out of the Holes in the Heavy Cast-Iron Rings, Comes from Hydraulic Jets Employed to Aid in Sinking the Pile

normal course. and jetting was in progress, when a column of water suddealy shot up to a very considerable height from the surface of the harhor a few feet from the pile. It was thought at first that the lower edge of the big cylin-der had broken through a subwater main, of which there are several in the vi-cinity. This was found not to be the case, and the only explanation forthcoming was that the water from the jet had found its way through

a fissure of some kind, and thus had broken through the harbor bottom and caused the alarming, fountainlike occurrence.

LOCATING UNCHARTED LAKES BY AIRPLANE

One of the latest uses of the airplane is locating and photographing many Alaskan lakes that beretofore have not appeared on any map. Recognizing that many of these "lost lakes" may be sources of valnable water power, the Forest Service, Department of Agriculture, with the approval of the Federal Power Commission, has laid plans to map this no man's land by means of aerial photographs.

SALVAGING A WRECKED OIL TANKER BY DOCKING IT SIDEWAYS

VERY unusual conditions accompanied the salvaging of the oil tanker "Chagres," which sank off a marine repair plant's wharf at New Orleans. By the use of compressed air, which was pumped into the hull to make it partly buoyant, it was raised with derricks and cables, but as soon as it reached the surface, it turned over on its side, and began to sink again. Tugs made a dash for it, and before the hull had time to sink, they got about two-thirds of it into a floating dock, which was then raised and repair was started.

AUTOMOBILE SAFETY BUMPERS STOP CAR AUTOMATICALLY

With an external mechanism that replaces the ordinary bumpers of a motor car or truck, an automatic brake and ignition control that stops the car quickly in case of collision has been designed, primarily to prevent accidents at slow speeds and in heavy traffic. The substitute for the bumpers, at each end of the car, consists of three small cables,

ove: Car Equipped with the Safety mper, Showing the Contact Cables Stretched between Goosenecks. Left; Phanton View of Automobile, Showing Wiring for Contact Bars, and the Brake and Ignition Control Bumper,

stretched between two goosenecks, the full width of the car like other bumpers. Any pressure on the cables that is sufficient to force them back 36 inch makes

flow to a brass case on the brake rod, which contains devices that auto-matically set the brakes, cut off the ignition to the engine, and

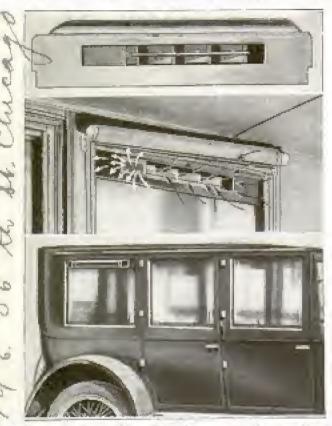

also blow the horn. By this means, it is said, a car can be stopped in one-third of the time and one-half the distance that would be possible with hand or foot an electric contact that causes current to brakes,

Elk Meadows, One of Nature's Beauty Spots on the Route of the Automobile Road That Loops Mount Hood: The Snow-Capped Peak of the Mountain can be Seen Towering over the Tops of the Intervening Pines

LOOPING MOUNT HOOD

BY S. GERTSMON, Huber, Oregon.

WHEN the automobile road, looping Mt. Hood, in Oregon, now under construction, is completed in 1924, the tourist who is so fortunate as to include Oregon in his itinerary will traverse 173 miles of scenic grandeur, not to be equaled the world over.

It is only after many efforts, and the cooperation of Multuomah and Hood River counties, through which this famous loop passes, that the building of a \$500,000 highway around Oregon's famous mountain has become an assured fact.

The Mt. Hood loop road is reached from Portland by way of Columbia Highway to Hood River, over 65 miles of never-to-be-forgotten wonders. One

Multnomah Falls, on the Columbia River Highway, Another of the Many Scenic Beauties to be Found near Mount Hood

passes, in succession, such interesting points as the Vista House at Crown Point, Multnomah Falls, Wahkeena Falls, Oneonta Gorge, Horsetail Falls, St. Peter's Dome, Bonneville Fish Hatchery, and Columbia Gorge Park. At the left, winds the Columbia River. At the right, and always in view, looms Mt. Hood, 11,225 feet high—a purewhite crystal set in a sea of blue.

At Hood River, the Columbia Highway is abandoned for the Mt. Hood loop road. Here, the road follows the Hood River and its east fork for 22 miles to Mt. Hood Lodge, then rises for 19 miles to Bennet Pass, and continues into the Oregon National Forest. Six and one-half miles from the

POPULAR MECHANICS

lodge the road crosses the east fork of the Hood River, skirting the east side of Elk Mountain, where it crosses several glacial streams from Mt. Hood before Hood before reaching the highest point of the loop, an elevation of 4.675 feet. From Bennet Pass, the road descends gradually, skirting the high southeast slopes of Mt. Hood, a distance of 10 miles to Government Camp, following, in a general eastward direction. the old Barlow Road, over which the early pioneers fought their way into the Willamette Valley. From here the road continues in its descent to the national-forest boundary at Zigzag Ranger Sta-tion. From this point, the southeastern extremity of

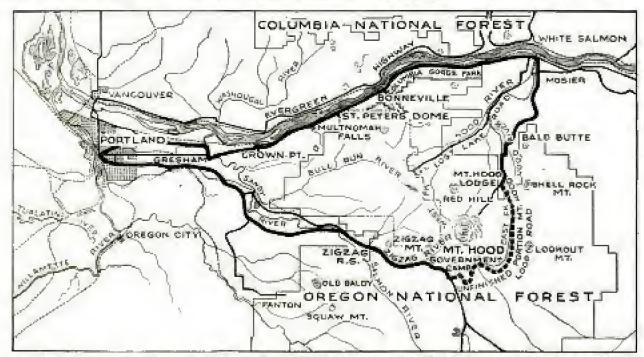

Looking across Lost Lake from Gifford's Point, Located near the Loop Road Encircling Mount Hood, Which can be Seen in the Background

the loop road, the tourist may return to Portland, a distance of 45 miles, by way of Gresham, with the choice of three highways entering the City of Roses.

At present, of the entire distance from Portland and back, circling Mt. Hood. 80 miles are paved, 22 miles macada mized, 14.5 miles partly graveled, 40 miles are dirt road, and 17 miles cleared but not graded. Twenty-two are being macadamized this year.

Forest-service contracts for sections of the Mt. Hood loop road call for a minimum width of 16 feet, not including ditches. The maximum grade allowed is 6 per cent, but none has yet been built to exceed 5 per cent.

Key Map, Showing the Route of the Loop Road Which Begins at the Hood River and Winds through 173
Miles of the Mount Hood Region, with Columbia Highway Completely Encircling

Porce newark. n. 1

Slab of New Building Material Composed of Cament, Sand, and a Substance Similar to Paraffin Wax, Showing Its Air-Cell Structure: The Other Side of the Slab is Backed with Wire Nesting

NEW-PROCESS CONCRETE MADE IN SHEETS

BY ALLEN P. CHILD #

NEW JERSEY manufacturer has recently developed an interesting building material in sheet form, I inch in thickness, which is made of cement and sand, and reinforced with galvanizedwire netting. In making these slabs, 3 cubic feet of cement and I cubic foot of sand are mixed with 7 cubic feet of small pellets of a material similar to paraffin wax. The necessary amount of water is added, and this is worked in a mixer to the consistency of ordinary grout and then poured into a steel form in which the wire netting is placed. About 16 hours are required for the cement to set hard enough to permit the removal of the material from the steel forms without breaking. The slabs are then placed in vertical rows, on steel cars, which are pushed into a big tank and there exposed to steam. The steam heats the slabs rapidly; the waxlike material melts and runs to the bottom and is conveyed to other

tanks. About one-half to three-fourths of the material is extracted in this manner. In order to get rid of the balance, the steam is superheated to a temperature of approximately 300° Fahrenheit, the remaining chemical evaporating and escaping, together with the steam, through a pipe on the top of the tank, and into an ordinary coil condenser. It takes 24 hours to remove all traces of the chemical from the slabs by the steaming process. After being cooled for a few hours, the slabs are placed in a steam curing room, where they are kept wet and hot. Two or three days of steam curing give them the necessary strength, and they can now be stacked outside and are ready for building purposes.

The slab resulting from this process is nothing but a skeleton of cement concrete, and the setting process, though interrupted during the extraction of the chemical, goes on afterward as in any

Construction of a Roof Deck with Slabs of the New Kind of Reinforced Concrete: These Slabs Are Only an Inch Thick, and Are of a Porous Structure, When Used for Such Purposes as Roofing or Flooring, the Slabs are Covered with a Thin Cement Finish

other concrete products. The melting of the waxlike material makes possible the formation of a very porous and light slab, but one of great strength. It is

claimed that the crushing strength of the slabs is 600 pounds to the square inch, but this is not sufficient for many purposes. In such cases the slabs are covered with a cement finish, varying from 1/16 to 1/2 inch in thickness, reinforcing metal then takes the tensile stresses, and the top finish takes the compression stresses as in reinforced concrete. The slabs weigh only about 55 pounds a cubic foot. When used in building stuces houses, they are nailed to wooden studs with the rough face out, and this serves as a base for the stucco. Nails are driven through

them easily without breaking the material. On account of the air-cell structure, they are good heat and sound insulators, and as exposure to high heat, steam, or water does not affect their strength, they are particularly useful where fire-resisting qualities are needed. They have also found use in

Dwelling, with Siding Made of the New-Process Concrete: The Outside Face of the Slabs will be Covered with Studen. Their Air-Cell Structure Making Them Good Heat and Sound Insulators

making roof decks and flooring, as well as for tile floors in bathrooms, hallways, and shops,

EMERY-WHEEL ATTACHMENT FOR FARM TRACTORS

A special emery-wheel attachment has been devised for use on the track-runner type of farm tractor. The regular belt pulley is taken off, and the emery wheel is put in its place. It is particularly useful to the farmer when the tractor is hauling a mower, the knives of which can be sharpened at any time on the emery wheel without any more than a short interruption of the work. The wheel may also be used for sharpening any other tools or implement parts.

(The British admiralty's leader cable that runs from Portsmouth about 20 miles out to sea, has been used for the first time by a merchant vessel, the steamship "Orbita." This is the only British merchant ship that is as yet fitted with the electric instruments that are necessary for the use of the leader cable.

HOUSE BUILT SINGLE-HANDED BY INEXPERIENCED MAN

Utilizing his spare time during a period of three years, a member of a high-school faculty in California has finally completed a home which contains all modern

Above is Seen the Vacent Lot as It Appeared Three Years Ago; Below, the Completed Modern Home, Together with the Improved Property

improvements. The piece of land upon which the house was erected was purchased by the amateur builder in 1917. He was at that time living on a ranch near the ocean, when, observing the fine drift logs that were constantly being cast

upon the beach, he decided to salvage them. Accordingly, he gathered a great number of the logs and then rigged up a crude sawmill, using an old automobile for power. With this outfit, the novice made all of the floor joists, posts, girders, rough boards, etc., for the contemplated

home, and then, with the aid of the old motor car, hauled the lumber to his vacant lot.

Although he had no previous experience in any of the building trades, he next excavated for, and then put in, a concrete foundation. The construction of the house was slowly accomplished, single-handed, with the exception of the electric wiring, roofing, and the mason work in erecting the chimneys. The completed dwelling has hardwood flooring, a furnace, and hot-water heat, tile drain boards in the kitchen, and a tiled

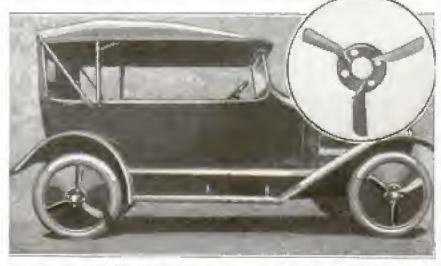

floor in the bathroom, which includes a shower. The proud owner claims that his total expenditures amounted to only \$2,000, not counting his own labor, and places an estimate of \$12,000 as the present value of his property.

SMALL FAN ATTACHMENT COOLS AUTOMOBILE DISK WHEELS

From the nature of their construction, disk wheels do not get the benefit of the

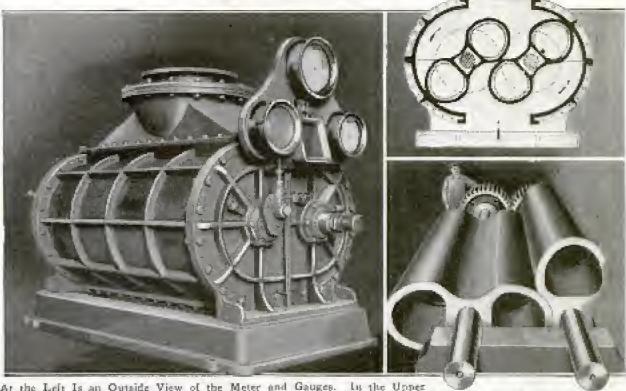

cooling properties of the air to the same extent as do open wheels. To counteract this disadvantage, a French inventor has patented a device for increasing the air circulation over the face of the disk by means of a fan. This can be applied to any disk wheel without necessitating any change beyond the drilling and tapping of a few holes. The fan is so shaped that it is protected by the wheel itself from any damage when the carriers along a sidewalk curb, or against any

other object that could reach inside the mudguards. The fan has propellerlike blades, but does not revolve independently, simply setting the air adjacent to the wheel into an eddying motion.

POSITIVE BLOWER MECHANISM BASIS OF NEW GAS METER

A new meter for air or gas, now on the market, utilizes the principle of the wellknown positive pressure blowers. In the new meter the impellers are constructed of reinforced aluminum and mounted on special roller bearings, so that they just clear the inside of the casing, making it unnecessary to provide internal lubrication. Due to this clearance, there is slippage of the gas back from the discharge to the intake, which, having been found to average about two per cent, is automatically corrected in a special recording gauge permanently attached to the meter. The meter also corrects for temperature and pressure, so that the gauge reading will be in cubic feet of gas referred to standard conditions. The cost is said to be considerably less than that of many older types of meters, which it equals in accuracy and efficiency.

ANGULAR-NOZZLE SPRAYER FOR UNDERSIDE OF LEAVES

Spraying a garden has been facilitated by the introduction of a portable compressed-air outfit, which is manufactured by a New York concern. In operation, the contrivance is hung over the shoulder of the user and a long angle nozzle extends down to the underside of the plants.

By this method, the under surface of the leaves, which is the starting point of most

plant diseases, is thoroughly treated in an easy and rapid manner.

(A bill has been introduced in the U.S. Senate to authorize the President to give Poland six American warships that, under the terms of the Washington agreement, would have to be scrapped.

by this condition, parliamentary powers have been obtained to build a port at St. Just, near Falmouth, on the coast of Comwall, where there will be a depth of 44 feet at low water, so that the largest vessels affoat could dock at all states of the tide. By this route passengers could reach London eight hours before those landing at Southampton, and on the western journey the St. Just passengers could remain in London eight hours longer than those traveling via Southampton.

ILLINOIS ZONING LAW MADE VOID BY COURT DECISION

The validity of the proposed Chicago city-zoning ordinance is now in suspense on account of a recent ruling of the state supreme court. One basic principle of modern zoning ordinances is that they are not retroactive, but the court decision goes further, for it states that: "An ordinance is void which prohibits one citizen from conducting a particular kind of business in a certain locality and permits another to engage in the same character of business in the same locality merely because the latter had established his business before the ordinance was passed."

HAND SPEED RECORDER GIVES READINGS AT A GLANCE

1861 Central Fire alarm Station

The Relay Receiving Board of the New York Fire-Alarm System, Which Distributes the Alarm to the Proper Stations, with Little Loss of Time, and Thus Assists in Speeding Up the Auswering of Calls

MODERN FIRE-ALARM SYSTEM FOR NEW YORK

NEW YORK CITY has just inaugurated a new fire-alarm system for

the Borough of Manhattan, that has taken a number of years to complete, at a cost of \$1,500.000. The system has been so perfected that it takes only 10 seconds for an alarm to pass through the central station and reach the station intended to answer the call.

9861

The central station has 217 workbox circuits connecting it with the 1,528 streetcorner alarm boxes, involving the use of 350 miles of cable and 17,000 miles of wire for the intricate telephone and telegraph system that interconnects the alarm boxes, central station, and fire houses.

When it is de-

sired to send in an alarm, the person goes to one of the fire-alarm boxes that are

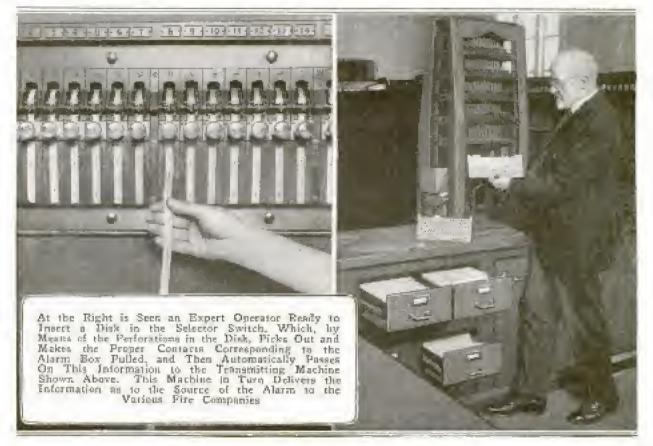

Old Tower and Bell, Relic of Early Fire-Alarm System, Still Standing in Mount Morris Park, New York City, Which at One Time Had a Number of These Bell Towers

located at every other street intersection, and, noting the instructions on the door, turns the handle until the bell rings. A mechanism is thereby set in motion that transmits to headquarters four complete rounds of the code signal indicating that particular box. After the first round has been received at the central station, the dispatcher takes from a file a perforated card corresponding to the box sending in the alarm, and places it in the selector switch. Directly after the second round from the box, he presses a key and sets in motion the automatictransmitter control. which instantly

The Expert in Charge of the Central Fire-Alarm Station in Central Park. Examining the Mechanism of the Automatic Selector Switch, Which Does Its Work with Accuracy and Dispatch, in Spite of the Complicated Appearance It Presents

sends the alarm to all fire houses, during the day, and to all companies due at the station on the first and second alarm, at night. This signal is thus transmitted twice over what is called a "combination circuit," and once over what is called the "gong circuit," to all the engine houses. The fire companies are under instruc-

d requires to - Umerican Painters.

POPULAR MECHANICS

tion to proceed to the point designated by the alarm, according to which station it is nearest. When the call comes in to the central station, it is heard and seen by the dispatcher and automatically registered to avoid error. The alarm boxes are of the succession-noninterference type, meaning that, if two or more boxes on the same circuit are pulled for a fire, each box will transmit its signal of the alarm to headquarters with no interference to the signal from any other box.

NONSKID FALSE THETH USE VACUUM-CUP IDEA

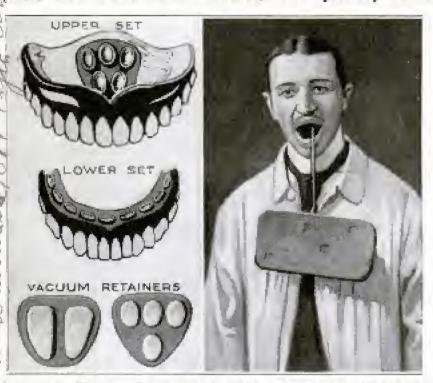

The problem of making false-teeth plates that would be comfortable and

plate and the mouth, rendered difficult because of the irregular contours of individual mouths and the presence of rough membrane. A recent invention has apparently successfully made use of the

vacuum-cup principle, familiarly used on the treads of nonskid automobile tires and some athletic shoes, for the alleviation of this diffi-

culty.

The rubber vacuum cups can be fitted to any style of artificial set of teeth. They are made of flexible high-grade rubber and vulcanized to a reinforced rubber backing, which combines rigidity with the essential flexibility. The vacuum cups have been found to retain their life and effectiveness for a long time, and the plates to stay so securely in place that they have not become dislodged by violent coughing, sneezing, or laughter. They may be as easily removed as the older types, when

316 TAPE TUNNEL OF THE BUREAU OF STANDARDS

One of the least known of the Bureau of Standards' multifarious activities is carried on in the so-called tape tunnel of that institution. Here the tapes used in the measurement of land and water by the Coast and Geodetic Survey, the International Boundary Commission, and other government bureaus, are standardized, all measurements being deduced from one of the original prototype meters which were deposited at the bureau when it was established in 1901. Concrete stands, each carrying a microscope at a convenient height for observation, are lined up at 5-meter intervals along the tunnel for a length of 50 meters. The center one of these intervals is similarly subdivided with stands spaced 1 meter apart. Here a 5-meter length is established by placing the standard meter bar in a V-shaped trough, wherein melting ice keeps the bar at zero centigrade, the temperature at which it is absolutely correct. The trough is mounted on a carriage that runs on a track so that the meter bar can be moved from microscope to microscope, each one being successively adjusted, by means of its cross hairs, to the exact meter length. When all are thus adjusted, a 5-meter bar is correctly standardized, and is then used in a similar manner to adjust the 5-meter intervals successively until an exact 50-meter length

between the first and the last of the microscopes is established. At each of these end microscopes is an instrument for transferring this measurement to a ball set into a ring in the floor. Resting on each of these balls is a vertical post which carries below the microscope a support for the ends of the tapes when they are heing standardized.

IMPROVED BLOWTORCH USES KEROSENE OR GASOLINE

A combination blowtorch offers refinements in design for the convenience of

users of such devices. An absolutely blunt burner needle. fitting into an open channel, is so constructed that it cannot easily be removed. Interchangeable gasoline and kerosene burner blocks are screwed into the burner

or filler plug. Cleaning needles are kept in a pocket in the hollow handle.

W. S. Weigle, Forest Supernear U. S. Veigle & agricultule Forest Service POPULAR MECHANICS "KEEP THE FORESTS GREEN," KEYNOTE OF PARADE

Floats Representing Smokers' Articles Carried in a Scattle Parade: Signs Warned against Their Careless Use in Forests

Assisted by prominent business men, automobile clubs, and civic organizations, Seattle recently held a parade protesting against an increase in forest fires which has come about, it is believed, because of the popularity of mountain automobile travel.

In addition to signs admonishing motorists and others to "Help Prevent Forest Fires," "Keep the Forests Green," etc., floats were used to further emphasize these points. Among the more interesting was a large pipe carried by two mountaineers, a large pasteboard match, and a cigarette. Each displayed a placard warning again the careless use of these articles.

DOG CLINIC IN NEW JERSEY OPENED BY KENNEL CLUB

With the sanction of the board of health, a kennel club at Closter, N. J.,

A Great Dane being Bound Up Preparatory to the Injection of the Rabies Vaccine at the Dog Clinic of Claster, New Jersey, Opened by a Local Kennel Club

has opened a dog clinic for the purpose of inoculating the animals with rabies vaccine. The reason for the innovation is that an ordinance passed by the city council permits dogs so treated to run the streets unmuzzled. The injection is claimed to make the dogs immune to rabies injection for one year.

PROTECTION OF GRATE BARS BY AN ALUMINUM COATING

Tests made in Europe have shown that pieces of metal protected by an aluminum

coating, as applied particularly to fire-grate bars and cast-iron stoves, give at least four times and, as a general rule, six times the service of untreated pieces. The aluminum is melted and is sprayed upon the articles treated, instead of being applied by the calorization process, well known in this country. Coated fire-grate bars, tested in locomotives, besides hav-ing their life greatly allowed increased, clinkers to be much more easily removed than untreated bars. However, the general results of the experiments show that the protection by the spraying process is not as effective under high temperatures as that

obtained by calorization. Further investigations are now being conducted /22

(It has been found that the use of nickel thuoride, in place of nickel chloride or sulphate, gives a finer-grained deposit of higher tensile strength and greater hardness in nickelplating.

ALPINE LAKES TO FORM LINK IN POWER PROJECT

Tunneling through the Rocky Mountain between the Kochel See and the Walchen See, in Bavaria: The View Shows the Operations being Carried On at the Walchen See Side, Which Is About a Mile Distant from Kochel See, and 650 Feet above It

There is in progress in Bavaria an engineering project which, when completed, will make that country practically independent of foreign sources of coal supply. By boring a tunnel about 2½ miles long

through the Alps, a portion of the flow of the Isar River will be diverted into the Walchen See, a mountain lake some 7 square miles in area and very deep. This lake will be used as a storage reser-

rent Fan Olever C

voir, and a second tunnel will lead the water to the Kochel See, less than a mile distant but 650 feet lower. This difference of elevation will make possible the development of sufficient electrical energy to operate all railroads and industrial plants in the country, besides furnishing light and heat for the cities.

KITCHEN-VENTILATING FAN

Smoke, odors, and hot stagnant air can be quickly drawn from any kitchen with

Klichen-Ventilating Pan for the Removal of Smoke and Stagnant Odocs, Shown Mounted in the Upper Section of the Ordinary Window

the aid of a ventilating fan manufactured in Chicago. In installing the fan, no alterations or electrical work are required, as the outfit has an adjustable frame which can be fitted in any ordinary window casing and fastened by five screws. The window may be raised or lowered at will when the fan is not revolving, but still in place. Either alternating or direct-current reversing motors are available, for which power is obtained by a cord attachment to any socket, and which operate with no more consumption of current than is used by a 50-watt tamp.

NEW AUTOMATIC LIFE-SAVING FENDER FOR AUTOMOBILES

To act in emergency as a life-saving fender, a substitute for the ordinary automobile bumper, occupying about the same space, has been demonstrated successfully in Alabama. The fender extends clear across the front wheels of the vehicle, and comprises parts that, when released by the operation of the emergency brake, automatically unfold a strong curtain, or flexible shield, which reaches to the ground. The result is that, if a person is struck by a vehicle equipped with this fender, the yielding cloth shield will pash the person ahead of the car for the short distance that is required to stop the machine with the emergency brake. Though designed specially to be connected to the emergency brake, the fender may also be operated by the foot brake. After use, it is refolded and returned to its normal position by a lever mounted within convenient reach of the driver.

Two Views of the Automatic Life-Saving Fender, Showing, at Left, the Fender Folded Up and Looking like Ordinary Bumper: at Right, the Curtain, or Flexible Shield, is Shown as It would be Automatically Unfolded by Striking Any Obstruction When Traveling. Any Person Struck is Pushed Forward until the Car is Stopped by the Emergency Brake

PAMOUS WILDERNESS PENETRATED BY HIGHWAY

C EREMONIES were held recently to celebrate the opening of the Hoback Cañon Highway, in Nebraska, which cuts through the heart of a wilderness famous in old-time western history and tradition. In the picture, the leader of the House of Representatives of that state is seen addressing a gathering at Jackson's Hole, designating one end of the newly completed highway which winds through what was formerly the "hangout" of many notorious desperadoes of that section of the country. The swaggering poses assumed by some of the feminine members of the audience would seem to indicate that the dashing and independent spirit, so prevalent in the older days, has passed from the male to the female branch of humanity.

INCLINED TURNTABLE FOR NARROW-GAUGE ROAD

Turntables for railroads are usually located on level ground, but one of these, built for a narrow-gauge industrial road on Vancouver Island, B. C., is constructed on an incline of 35°. The motive power for the cars used on this railway is furnished by compressed-air winches and steel cables. About halfway up the grade, a turn of 60° is required, and here the turntable is installed. One winch pulls a car up to the turntable, whereupon another cable, coming from a winch at the head of the second stretch of track, is attached. The car is then turned to the other set of rails, and locked in position on the table while the cables are being changed.

1 ds = 5

high, with cires 10 inches wide and special bearings in the hubs, and a rack and pinion on the reach for raising the load under pull. The gear ratio is such that the load is readily lifted clear of the ground when the wheels are under pull and quickly dropped if the wheels tend to erowd the tractor on downgrade. wheel has a capacity of 2,000 feet of humber per load, and it has been found that when logging at a distance of 800 feet, at an effective tractor speed of three miles. per hour, this equipment will easily deliver 2000 feet of lumber per hour.

LARGE POWER PLANT OBTAINS EFFIGIENT GAS BURNING

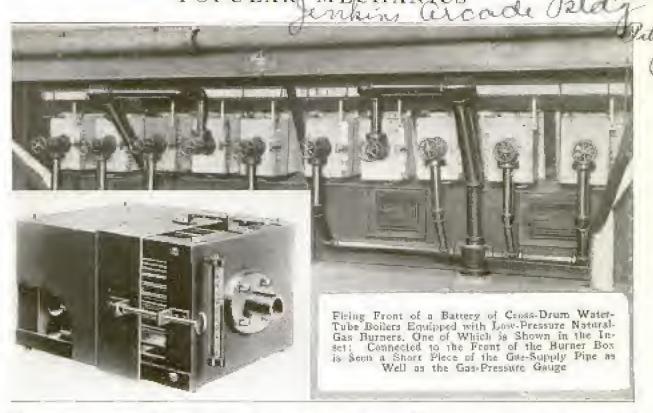

Evaporation tests recently concluded at the world's largest gas-fired boiler, plant of 12,600 horsepower, seem to upset the quite prevalent idea, that natural gas can only be burned economically under high pressure. In this test, lasting 14 hours, with an average gas pressure of less than 6 ounces, and at boiler loads of 110, 214, and 302 per cent, an average' gross efficiency of 87.8 per cent was obtained.

These excellent results are attributed mainly to a recently invented low-s pressure type of natural-gas burner, as \$ it was recognized that economical results \$ could not be expected from the older types of burners, requiring higher gas pressure than is now generally available.

Crawler-Type Tractor and All-Steel Logging Wheel Engaged in Hauling a Large Log through the Forest in California: Note How the End of the Log at the Wheel is Held above the Ground

9908 Burners made by 1-Iluquerne Burner Service Co POPULAR, MECHANICS POPULAR, MECHANICS Junking arcade Blagg

The advantages claimed for the new burner are: that it will operate efficiently at any practical boiler rating, with a gas pressure varying between 1 and 4 ounces; that back-firing is impossible; that the annoying vibration and roar of the highpressure types is climinated; that burning out of nozzles is prevented because of the low pressure, and that a nonoxidizing flame is produced.

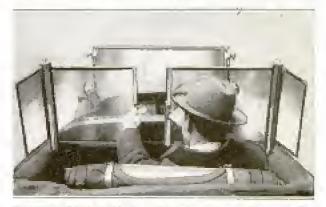

The gas supply is connected to a castiron box at the front of the burner, from which lead a number of small pipes to the back or burning end, where the mixing plate is located. This is provided with holes corresponding to the number of nozzles. The whole is surrounded by a steel box, which, with the assistance of a telescopic slide, regulates the admission of air. A slight draft from the furnace supplies the necessary air. -1

WINDSHIELD FOR REAR SEAT ON AUTOMATIC ROLLERS

Passengers in the rear seat of an automobile can now enjoy the ride without any discomfort caused by the strong wind, by the use of a simple and flexible windshield or screen which has lately been introduced in Paris. The contrivance, which is made of celluloid, has two sections, each of these being housed in a small nickelplated tube that is fastened to the side of the car. When the occupant of the rear seat objects to the wind. he merely reaches over and pulls the two

ber, it was possible to steer the rear end of the timber and make the trailer follow the wagon that carried the front end of to the gun, and a similar hose connects it the long timber.

PENTURI-TUBE PRINCIPLE IN EXHAUST MUFFLERS

By making use of the properties of the Venturi tube, a new muffler has been developed that will eliminate the noise of rapidly expanding gases, such as the exhaust of an engine, and as there is no retardation of the flow of the gases, there is also no back pressure, or, at the most, much less than in mufflers of the ordinary straight tubular construction. These silencers are cylindrical and are of two types. One that is used in connection with gas and oil engines is attached to the end of the exhaust pipe. It consists of a series of tapered tubes that alternate with straight tubes so as to give a series of Venturi discharges. The other type is intermediate on the exhaust pipe, and

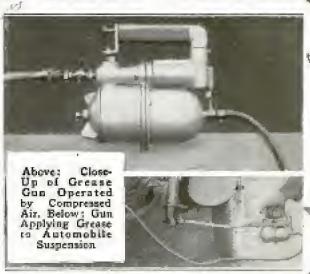

New Type of Muffler That Connects to the End of the Engine Exhaust Pipe: The Small One Is for Three-Inch, the Large One for 12-Inch Pipes

is used on large engine installations on motor ships. Inside its cylindrical hous-ing are a series of cast-iron units attached to the cylinder head, and these are in the form of spirallike passageways, in which at intervals are diverging and converging Venturi throats. 960

AUTOMOBILE GREASE GUN OPERATED BY AIR

Grease guns are now in favor for forcing grease under pressure into the working parts of automobiles. An improvement of this idea is a new grease gun that is not operated by a hand plunger but takes air from the spare tire, or other

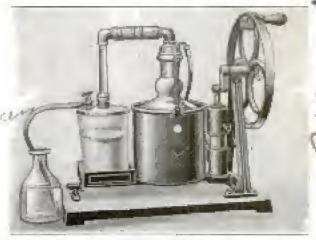

source, which forces the grease into the desired part. A flexible hose supplies air

with the part to be lubricated. A trigger, operated by the thumb, serves to control the flow

HAND-OPERATED ICE MACHINE FOR USE IN THE HOME

Making ice by hand is a rapid and inexpensive process when a small ma-chine recently introduced in England is used. The action of the machine is based on the principle that water freezes whenrapidly evaporated in a vacuum with sulphuric acid to absorb the vapor. The contrivance is especially adapted for icing mineral waters, making ice cream, cooling butter, etc., and if desired, a block of ice weighing 2 pounds can be produced in 20 minutes, thus proving the machine to be a valuable and handy addition in any home when it becomes necessary to provide ice in an emergency.

FIVE TOOLS FOR ONE HANDLE OF LIGHT GARDEN SET

Five tools which can be interchanged in one handle compose a garden set now on the market. The tools are constructed

Garden Set Consisting of Pive Aluminum Tools Which can be Conveniently Inter-changed in One Handle

of aluminum, and consist of a trowel, spade, rake, weed scraper, and seed-trench hoe. The handle, made of wood, is only 9 inches in length, and the complete outfit is an efficient and lightweight set, which should be welcomed by anyone engaging in garden work.

REAMER HOLDER TO PRODUCE ACCURATE REAMING

In order to obtain accurately reamed holes, the reamer should be rigid. A holder, adaptable to turret lathes, has been developed that insures the proper centering and alinement of the reamer with the work. This is accomplished by means of hardened and ground machinesteel faceplate adapters that can be attached to the tool holder or the turret of the lathe. The reamer holder and the centering plug are made interchangeable to fit the faceplate adapter, and in this way the work is accurately centered; and alined, and afterward reamed.

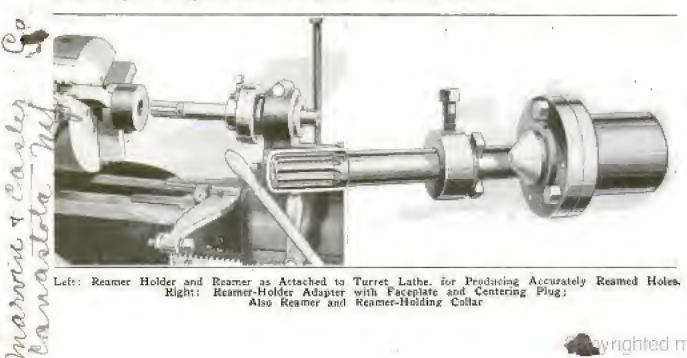

9825 NEW DEVICE FOR HANGING. PICTURES AND MIRRORS

An adjustable device, for hanging pictures and mirrors, provides two hooks upon which to rest the lower edge of the frame. A chain, attached to the top of the frame with a hook, passes through a pulley fastened to the wall, down to a hook in the wall, where it is secured. With this arrangement the picture or mirror is adjustable to any angle and

Umaren 11 With TRUCK BRINGS READY-COOKED 9 341 MEALS TO HOMES

The tendency of modern times seems to be the reduction of household drudgery to the lowest possible limit, and with this idea in mind, a man living in Leeds, Eng., has fitted up a truck as a traveling kitchen, from which he delivers cooked fish and chipped potatoes to the housewife, ready to be served on the table. The food is cooked in specially fitted pans over a coal fire. The truck also makes the rounds of carnivals or athletic events where large crowds are accustomed to gather, serving the same fare from a counter in the side of the vehicle.

TIERING MACHINE DOES WORK OF NUMEROUS KINDS

Tiering machines, although primarily designed for the purpose of stacking or piling boxes, crates, etc., in warehouses and on docks, can also be used in various other ways. One of these machines, manufactured by a Chicago concern, was recently utilized by a rigging gang in hoisting radiators, motors, line shafts, and heavy pipe to hangers on the ceiling. The appliance is actually a hand-power elevator, having a platform that is raised by the turning of a crank and lowered by Economy 26400

gravity, a lifting capacity of 1,500 pounds, and a removable section so that it has a fair range of adjustability for operation with varying ceiling heights.

PLAYGROUND FOR THE PEOPLE IN NATIONAL FOREST

The city of Butte, Mont., has recently been the object of a signal piece of national legislation in acquiring the use of a playground area for its people in the Deer Lodge National Forest, as briefly recorded in the August issue of this maga-

zine. For some time the city authorities had been desirous of using this tract for a park, but as the national-forest lands are open to mineral prospecting, the fear that whatever improvements might be made by them would eventually be hurt

Close-Up of the Lan in the Park That Forms a Playground Area in the Deer Lodge National Forest Set Aside for the Use of the People of the City of Butte: The Inn Is Only About Nine Miles from the City

The Park Reserved for Recreational Development Viewed from Lookout Point, and Showing a Short Stretch of the Yellowstone Trail: This Part of the Trail has been Given the Name of "Harding Way"

or spoiled by claim locations, kept them from doing anything definite in the way of establishing the park. So, recently, Congress passed a bill which empowered forms of entry, so that the lands are as free from unauthorized use as if the city owned them in fee simple. One of the purposes of this service is that of encouraging all legitimate uses of the national forests, and it is felt that the legislation in favor of the development of the recreational life of Butte, will do more to help in that respect than any other that has been passed since the forest was created. The tract made available to the city is about 3,600 acres in extent, in Nine Mile Cañon.

any spear, sword, or knife of native make. But more interesting than its making is its former use, proving that knights who did chivalrous battle were not found in Europe alone. So difficult was the armor's manufacture that only one suit was owned by each Gilbert Island village. Thus, when trouble arose between two villages, the best man from each donned his armor suit and went out and settled the matter by single combat. The introduction of the white man's ways and his weapons has caused the almost total disappearance from native ownership of these strange but skillfully made suits, most of them having been carried away, by collectors. 09

CONVENIENT T-SQUARE GUIDE FOR DRAFTSMEN

Draftsmen often find it necessary to work on a drawing that is beyond the reach of their T-square, or on a long drawing that has to be rolled. In such instances a straightedge guide, readily attached to the board or table top with thumbtacks, will serve the purpose of holding the head of the T-square in aline, ment as, in the ordinary manner of working, the edge of the board does,

AMERICAN AUTO MAKES ATTRACTIVE HANSOM CAB

Here is Pictured the Hansom Cab of Today, Built on a Light American Automobile Chassis. The Only Missing Parts Are the Shafts and Horse. The Driver's Seat Being in the Rear, the Passenger Enjoys an Unobstructed View and a Feeling of Greater Privacy

The introduction of the automobile with its conventionalized lines, has witnessed the passing of the picturesque horse-drawn vehicles of a generation ago. A revival of one of these has recently been seen on the boulevards of Paris, in the appearance of a modern adaptation of the once familiar han-som cab. The version of today shows the driver with his hands on the steering wheel instead of on the reins, and wearing a chauffeur's cap in place of the dignified "stovepipe." Our "cabby" does not worry about oats to fill the feed bag, nor about blanketing his horse.

MODEL OF "LEVIATHAN" PASSES

At the time when the "Leviathan," then the "Vaterland," belonged to the Hamburg-American line, expert workmen were sent over from Germany to build a model of the famous ship. The model, 18 feet 6 inches long, 1 foot 11½ inches beam, and 1 foot 5½ inches in depth, was held by the alien-property custodian during the war, but has now been turned over to the United States Shipping Board and stands in the main hall of its offices at Washington. The model cost, \$25,000 to build.

USE AIR DRILLS AND WEDGES TO BREAK UP CONCRETE-

The difficulty of breaking up well-set concrete structures was forcibly illustrated at Second Avenue and Street, New York City, when the work on the new subway along this street required a rearrangement of water mains, and electric and gas conduits. At Second Avenue two huge reinforced-concrete anchors were built for the hoisting and lowering cables used in this heavy work. Each of these artificial-stone bowlders was 15 feet long, 7½ feet tall, and 5 feet wide. As the two anchors were built on the outer edge of the sidewalk, their removal was begun immediately after the rearrange-ment work was finished. No blasting being allowed, the air drill was the only means of breaking up the congrete anchors, so two drillers were put to work on each anchor, while two other men used the sledge and wedge for breaking off the drilled sections. While each

Above is Shown Men at Work with Air Drills, Making Holes in a Large Concrete Anchorage, Preparatory to Breaking It Up with Wedge and Sledge Hammer

anchor was built in a little over a day, it took almost two weeks to break up and remove each of them.

Engine G & alexander + h

A cylinder-grinding attachment for either lathes or milling machines, produced in New Orleans, makes a special machine for this purpose unnecessary, and should therefore be of advantage to small service stations. The grinding head is mounted on the driving spindle of the lathe or milling machine, and the

cylinder block is centered and then fastened to the carriage of the lathe or the table of the milling machine. In the head is gearing for running the grinder at various speeds, and a special centering jig is provided.

Cylinder-Grinding Device Operating in Connection with a Milling Machine: The Cylinder Block is Fastened to the Table, and the Grinding Head is Mounted on the Driving Spindle

The Wire Cage was Mounted on This Machine After the Driver had been Seriously Injured by a Stray Golf Ball. Two Horses were Killed on the Same Course before the Installation of the Motor Driven Lawn Mower

SHIELD LAWN-MOWER DRIVER FROM STRAY GOLF BALLS

Is the operator of a mowing machine on a golf course likely to meet with death? Authorities of the Lincoln Park golf course in Chicago answer in the affirmative. After two horses had been killed by misdirected golf balls, a small automobile was adapted to draw the lawn mower. The problem seemed solved. But the second day the driver sustained a blow on the head that resulted in a trip to the hospital. Now the driver is inclosed in a wire case. 7

NEW FORM OF DOUBLE RUDDER BEING TESTED IN GERMANY

There is being fitted to an 8,000-ton motor ship now under construction at Hamburg, Germany, a new form of rudder, which has already been used with marked success, it is said, on comparatively small-sized vessels. Hinged to the rear end of the main rudder, which operates in the usual way, is an auxiliary rudder. To turn the ship to port, this auxiliary rudder is moved to starboard with the result that the water pressure on this auxiliary portion of the rudder moves the main portion to port. It is claimed that this greatly reduces the power required to move and hold the rudder, and that, consequently, smaller steering engines can be used. Flettner, us. anten Flettner, (Iserman)

DEVICE FOR STRINGING CORN IS SIMPLE AND RAPID

For rapidly stringing ears of corn so that they may be hung up for drying and for storage, a device has been invented that consists of inclined frames, over one of which the stringing cords are drawn tight, while on the other the operator weaves the cords successively around the ears. Horizontal guide bars, operated by the up-and-down movement of a treadle, cross the cords alternately over the ears, and weave them together without bruising them. The treadle operates against the tension of a coiled spring above it.

Uncovered by the Excavation, Which Revealed the History of 26 Generations of
Ethiopian Kings, and the Arts of a Lost Civilization

WORK OF THE ARCHÆOLOGICAL EXPLORER

BY F. N. HOLLINGSWORTH

PEOPLE often wonder 1000 Palestine, Mexico, and elsewhere make their discoveries; how they know where

to look for what they find, and how they know that anything may be found where they search,

The work of the Harvard University -Boston Mu-seum of Fine Arts expedition to Ethiopia, which has spent 10 years in Egyptian archæological exploration and is still working there, is an in-

teresting example of how such explorations are carried out. Its search has resulted in the discovery, in an obscure vil-

lage beyond the borders of Egypt, on the

A View of the Burial Chamber of King Shebitku, with the Broken Coffin Bench Showing in the Foreground

banks of the Nile River, of a preat numb ber of tombs which were found to con-tain the history of 26 generations of Ethiopian kings who ruled over Egypt, and the recovery

from beneath the deeply drifted sands of material buried and lost to human knowledge for thousands of years, revealing the arts and crafts of this lost civilization. The discoveries were made at Napata, the capital of Ethiopia.

Archwological exploration work requires engineering

and architectural knowledge, along with many other things, such as knowledge of ancient languages, hieroglyphics, ancient history, and the arts and crafts. The explorer comes upon a mound, or series of ered as having washed in from the mounds, of drifted sand in the desert in a thieves' tunnel outside. When the sand

region known to have been inhabited by ancient races. He sets his trained workmen to clearing away the sand, after first having made photographs of the undisturbed site. As soon as a tomb or pyramid is uncovered, the stairway leading into the tomb is the first to be cleared. This had been filled in after the funeral with the clean débris left after the excavation of the rock-cut chambers and the building of the pyramid. Then the plunderers came, at some time or other, and dug a hole in the clean filling of each stairway, this hole

afterward becoming stopped up partly with the things that the grave robbers threw away as valueless, and partly with drift sand. The robbers were naturally after the gold and jewels they knew had been buried

in the royal tombs. It is easy to distinguish between the original filling and the débris of the thieves' tunnel. The objects found in the latter usually came from the royal hurial chamher and, in the records of expeditions, have to be carefully distinguished from other objects. When the doorway at the foot of the stairs has been reached, the workmen begin to clear the pyramid above. another stairway, until the record of the blocking and measurements of the stairs have been made. After

that, the sand is Stairway Seen L removed, leaving only about 8 inches of the floor debris intact. Whatever is found in the sand and it is usually little enough—is consid-

Necklaces of Garnet, Carnelian, Wrought Gold Beads, and Amulets, Taken from the Early Tombs of the Ethiopians

is out, then the serious and difficult work of examining the floor débris and removing it bit by bit begins, and for this only the most skilled Egyptian work-

skilled Egyptian workers are employed, under the supervision of a member of the expedition. This floor dirt is to the Egyptologist what pay dirt is to the

gold miner.

Detail photographs are made of the excavation as it progresses, both inside and outside of tombs and pyramids. Then the important objects which are found within are photographed, usually with a scale beside

them, so that their actual size is shown. In the case of the Ethiopian expedition here referred to, some of the finds were unique. Outside of the importance of the discovery of a hitherto lost period of

ancient history, this expedition obtained a magnificent collection of speci-mens of the work of the royal craftsmen - of the goldsmiths, the coppersmiths, ivory carvers, makers of stone vessels, the faience workers, and the amulet cut-In other ters. words, the expedition established a practical monopoly of the royal works of Ethiopia, which have been brought to America and deposited in the Boston Museum of Fine Arts for the study and benefit of American craftsmen and designers. So small are many

The Vaulted Burial Chamber of King Pankhi, with Stairway Seen Leading Downward

of the objects found in these ancient ruins, such as beads and amulets, that they would be lost or broken if picked up with

an ordinary shovel and turned over with the dirt. The work is done by hand, the debris being picked over and examined bit by bit. This care resulted in the finding of several strings of beads and necklaces of gold, garnets, faience, and semiprecious stones, which were later put together in matched order and photo-graphed. Another discovery was a horse cemetery - the first ever found in the Nile Valley. The graves were in four rows, and contained the horses of some of the famous Ethiopian kings. All had been plundered, but enough remained to show that each horse was buried upright with its head toward the south. The trappings found included a plume carrier of gilded silver strings and bronze balls.

9627 NOVEL WHEEL PUMP FOR DRAINING MARSHLAND

But for a novel kind of wheel pump, designed by its owner, a now fertile farm

of 196 acres bordering on Lake Erie, six miles west of Sandusky, Ohio, would still be mostly an untillable area of marshland, as it was only six years ago. The wheel. 16 feet in diameter, has a number of radial paddles, 14 inches wide, connected to a gear forming the wheel rim. Geared to this is a 9-horsepower gasoline engine that drives it. The wheel is mounted over a water pit, into which tile drains lead from all parts of the marshland. As the water collects in the pit it is lifted by the paddle wheel to a flume above, which only a small part of the farm could be cropped, last year the farm produced

carries the water into the lake. Whereas, 5,000 bushels of shelled corn, and wheat before the use of this drainage system, yielded an average of 35 bushels an acre.

BRICK CHURCH BUILT AROUND FRAME STRUCTURE

around the little old frame structure that

Building their big new brick church had served so long as a house of worship, was an idea conceived by the deacons of

a colored congregation in Lexington, Ky. The reason for this odd procedure was the pardonable unwillingness of the zealous brethren in charge, to run the risk of losing any of the fickle members to a rival church during the construction period. Consequently, the imposing brick edifice was reared over the unpretentious wooden shack, the latter not being torn down until its presence hindered progress on the new building.

DETACHABLE ROCK-DRILL BIT INDICATES ECONOMY

A radical departure in rock-drill practice is the adoption, by a western mining company, of a detachable drill bit. The bit and drill rod are fitted together

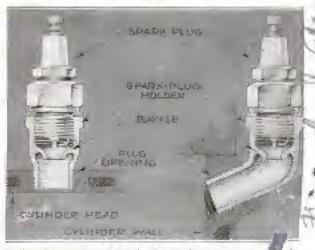

Right: Cutting Face of Detachable Rock-Drill Bit. Left: Showing Tongue on End of Bit. Which Attaches It to Drill Rod

with an accurately machined tongue and groove, which, being inserted on a taper, tighten with each succeeding stroke of the drill. A few blows from a hammer suffice to loosen the bit. This reduces the expense of handling the drill rods to and from the work for sharpening, and permits the use of the highest-grade steel in the bits, giving greater drilling speed. The hits can be reground, without retempering, to the next smaller size a number of times, thus eliminating another item, of expense.

NEW SPARK PLUG HOLDER PREVENTS FOULING

Some automobile engines pump oil into the combustion space. If the spark plugs are located in the cylinder wall so as to catch this oil, excessive fouling occurs. The result is irregular firing and unsatisfactory operation. A man exasperated with this trouble, has devised a holder which screws into the cylinder in place of the spark plug. The holder carries the spark plug in such a position that the oil does not reach the points, and fouling is prevented. An added advantage claimed

Left: Nonfouling Spack Plug Attached to Inder-Head of Gasoline Engine. Right: Sin Plug Shown Attached to Cylinder Wal

for this device, is a perceptible innerse in power. The holder does not become sufficiently heated to cause preigntion, because the cylinder is water-jacketed at that point.

¶A French scientific magazine reports that a method of utilizing earth currents of electricity has been found. No description of the apparatus is given, but it is inferred that ordinary electric lamps can be lighted by earth currents, and that when a special static transformer is available, distribution will be possible.

MOISTURE TESTS MADE ON CONCRETE ROAD PAVING

A LONG either side of a test highway at Pittsburg, Calif., ditches were dug in such a manner that they could be filled with water to the level of the top of the subgrade. Through holes provided in the concrete paving, berings were taken of the subgrade, before the water was turned into the ditches and afterward, to determine the variations in its moisture content. In tunnels constructed under the paving, observations were made of the effect of different degrees of moisture on the carrying power of the paving under traffic conditions.

FRAME
RAPREL
TRIGGER
SPRING
FRAME
RAPREL
TRIGGER
WIRE
GROUND SPIKES

A self-exploding gun for the extermination of pocket gophers is now being used by a number of farmers who are bothered with these pests. It is also used, in some cases, against rats, ground squirrels, and skunks.

The gun looks like a miniature cannon. It is mounted on an aluminum frame with three ground spikes so arranged that the barrel can be pointed directly into the gopher's runway. It shoots a standard ,410 shotgun shell. In setting, the dirt is first scraped away from the hole. The gun is then spiked into the ground with the barrel pointing down into the burrow. A small piece of cork or cob is placed over the end of the trigger wire. With the trigger cocked and set, and the firing pin in place, the gun is ready for the discharge. As the gopher always tries to keep out all light from its runway, it will soon come up, pushing fresh dirt into the opening. The slightest pressure on the trigger-wire cork releases the hammer, and bang! the full charge of the shot hits the gopher in the face. The gopher virtually commits suicide.

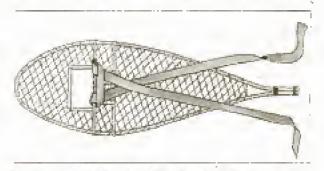

HORSESHOE-PITCHING ARENA HAS TWENTY COURTS

What is said to be the largest horse-shoe-pitching arena in the United States was built at Des Moines, Ia., for the national horseshoe-pitching tournament, held at the Iowa State Fair in the last week of August. The arena contained 20 courts, all of them surrounded by bleachers. Women contestants used four, while the rest were occupied by men. Thirteen hundred dollars in prizes were awarded to the winners.

METAL SNOWSHOE DESIGNED ESPECIALLY FOR CHILDREN

Because there is no gut to be eaten or destroyed by ice, and because it is much lighter in weight and cheaper, an eastern company is manufacturing a metal snowshoe which it claims is practically indestructible. None of the standard features of the ordinary shoe have been,

changed, except that nonrusting metal has been substituted for the gut weave and for the wooden frame. This makes

Nonrusting Metal is Used in the Construction of This Snowshoe Instead of the Regular Gut Weave and Wood

a lighter shoe which is especially useful for children.

¶We want all our readers to write us freely and often whenever they wish additional information on articles published in this magazine. Address Bureau of Information, Popular Mechanics, Chicago.

SAND-DRYING STOVE BUILT TO RESIST HARD USAGE

A strongly built sand-drying stove for use on railroads, in foundries, and other

industrial plants, has a small furnace at its center which is surrounded by an upright cast - iron grating. Around this again is a conical skirting that incloses the into space which the wet sand is shoveled. As soon

as the sand is dry, it runs through the grating into the hot-air space around the furnace, and then out through a per-forated ring below the skirting and the grating. The furnace is fed through a

fire door outside the skirting.

USE CYLINDRICAL LUNCH BOX AS EXTRA AUTO SEAT

A fiber lunch box which can be used as an extra auto seat has been designed to

aid the motorist who desires to minimize the space taken by outing equipment. The box looks somewhat like an oversized vacuum bottle. A tray held by three uprights forms an "elevator" which is lowered as the box is

filled. When the contents are wanted the lid is removed and the elevator raised.

LIME-SECRETING SEA PLANTS HELP IN REEF BUILDING

The generally accepted idea that corals alone play any part in reef building was disputed recently by Dr. Marshall A. Howe in a lecture on "The Plant Life of the Sea." He stated that recent re-

searches show that in some localities limesecreting plants have played a more important part than the corals, and that in all cases they have contributed more or less to the reef building. Doctor Howe showed more than 100 lantern pictures of the more interesting forms of marine plants, particularly those known popularly as seaweeds and mosses. He showed how the minute inclosing membranes of these organisms are permeated with silica, which renders the plants almost imperishable 559

LUMINOUS POISON INDICATOR PREVENTS ACCIDENTS

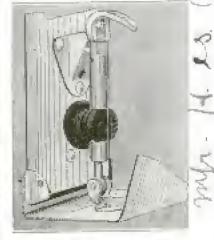

Accidents caused by taking the wrong medicine or poison by mistake, in the dark, may be averted by the use of a new luminous indicator. The label, when fastened to any bottle, glows, brightly in the darkest places and is guaranteed to retain its luminosity for five years, when kept within the usual medicine chest.

(icce +) ATTACHMENT FOR AUTO HOODS PREVENTS RATTLING

Made to fit a standard fastener on the hood of an automobile, a device for pre-

venting the hood from rattling is now on the market. It is made of rub-ber, in one piece, and is attached to the rod of the hood fastener. In connection with it is a small vacuum cup that fits against the side of the

hood and prevents it from moving. Being made of rubber, it is very durable.

BIRDS ANSWER DINNER BELL AT STATE GAME FARM

Answering the dinner hell is one of the joys of bird life on the State Game Farm at Forked River, N. J., where thousands of pheasants are reared annually. Every effort is made to raise the young birds as near to wild methods as possible, since they are to be ultimately distributed for hunting purposes, but the scarcity of natural food has necessitated the introduction of one domestic trait, namely—"first call to dinner."

FORESTERS RISK HIGH CLIMBE 2

959 AS PART OF DAILY ROUTINE

Climbing a 100-foot ladder is the first job in the day's routine of a Canadian forest patrolman located in the province of Saskatchewan. Such towers are common in this service, but it is not often that the cameram an has an opportunity to snap the forester "en route." The accompanying pho-tograph gives a good idea of the size of the towers and of the risk involvedin climbing them. This takes about five minutes.

PECULIAR WRECK OF AIRSHIP 9923 LANDS CREW IN SEA

An unusual accident recently happened to an Italian airship which, returning from a trip over the Gulf of Taranto, encountered a storm. The fastenings between the car and gas bag broke, dropping the car and its 20 occupants 600 feet into the sea. Boats from shore were in time to rescue the crew.

DESIGN OF NEW GAS VALVE

d nv. J. J. Leege

Taking advantage of the fact that there is less loss of pressure in a gas when passing through a thin-walled orifice than when passing through an ori-

Loss of Gas Pressure in the Valve of a Gas-Range, Burner is Remedied by Using a Number of Gradpared Diametera Instead of the Usual Movable Plug

valve for gas-range burners has been designed that is a radical departure from the usual valves. Instead of one straight opening through the movable plug, there are a series of openings of graduated diameters, all connecting with the supply side of the gas main. This construction results in a considerable increase in efficiency.

LINOTYPE-SLUG ADJUSTER HAS ANTIFRICTION ROLLER

For the convenience of linotype operators who have had trouble with the slugs of

type getting out of alinement or sticking in the slide, as they pass from the knife block to the slug tray, an adjuster, intended to overcome this trouble, has been patented. It holds a roller made of antifriction metal against the face of the slugs as they come from the knife block, insuring even delivery to the slug tray.

Those wishing further information on anything described in the editorial pages can obtain it by addressing Bureau of Information, Popular Mechanics Magazine, Chicago.

MECHANICS. 1-9

DEVICE CONVERTS ANY SCALE TO AUTOMATIC MACHINE

By attaching a recently invented electromagnetically operated device to any re-

liable scale, a complete waiting container. As the scale platform descends, the weight-control rod gradually lifts out of a mercury chamber a rod that completes the electrical circuit maintaining the magnetic properties of the solenoids. When the desired weight in the container has been reached, the rod-mercury circuit will be broken, and the hopper valve will close.

TENNIS COURTS COVERED WITH ROOFING

A tennis club of Sts Louis, Mo., has recently converted its outside clay courts into courts that may be played upon during wet weather during the winter months. Cinders and an application of roofing material did the trick. First, 6 inches of clay were removed from the Coarse cinders courts. were then obtained and put in place of the clay. After rolling and packing the first course of cin-

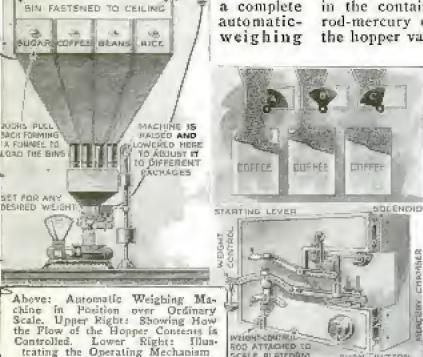

ders, another layer of finer cinders was applied, which raised the courts one inche higher than the surrounding ground and thus facilitated drainage. The courts. thus facilitated drainage. were then leveled, and two layers of three-ply roofing material were laid across the courts, in opposite directions. The net posts were left in the same position,7

NOVEL PISTON TO KEEP OIL FROM COMBUSTION SPACE

Carbonization in gasoline-engine cylinders largely results from oil leakage from

the crankcase past the piston into the combustion chamher. A piston designed to eliminate this, provides a cupped groove to break the capillary action and to catch the oil. Holes through the piston wall equalize the pressure on the oil, draining

it back into the crankcase, also increasing ring pressure against grooves and cylinder walls.

unit is formed. The apparatus is readily connected to any size or form of hopper, and allows only an exact quantity to pass through an opening, which closes automatically when the predetermined weight has been reached. It is also adjustable to take care of the variations in weight of the containers, and gives in all cases the actual net weight of the product weighed. It is possible, without any inconvenience, to check its work by reading the dial of the regular scale. No changes in the adjustment of the scale are necessary.

The accuracy of the device is remarkable. In one instance a pound of beans was placed in the hopper. Three of the beans were removed. The pound of beans minus the three beans was delivered to the receiving container, but the hopper valve did not close. As soon, however, as the three missing beans were placed in the bag, the valve closed auto--matically. Such a degree of sensitiveness surely is not within the reach of the average clerk,

The hopper valve is electrically controlled by two solenoids. Assuming that the desired weight has been adjusted on the curved weight-control arm, the starting lever is pulled down. This changes the position of the hopper valve, allowing the material to discharge into the

CHROME-PLATING POSSIBLE BY NEW PROCESS

Chromium can now be deposited as a thin coating on the surfaces of iron, steel, and other metallic objects, similar to nickel and copperplating, by the process of a German chemist. The important properties of chromium are its resistance to corrosion and abrasion, and its relatively high melting point. The availability of this useful metal has been considerably extended, because it has only been prepared with difficulty by any of the processes heregofore devised.

TUBE FOR GASOLINE TANKS PREVENTS EXPLOSIONS

A tube which eliminates the danger of explosion of gasoline has been indersed by insurance underwriters for use on automobiles and other types of gasoline tanks. The ordinary intake cap is re-

placed by a cap with a springed hinge which keeps the cap closed. Attached to the base of the cap is cylinder with small perforations, inclosed a fraction of an inch away by a brass strainer. Neither flame nor gasolinė vapor can penetrate this tube. And if the tank is subjected to excessive heat, the cap opens automatically, releasing pressure and preventing

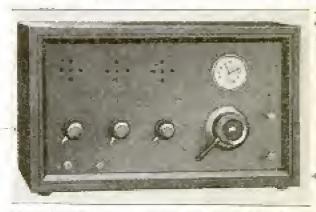

bustion.

the fact that the air hole in the smaller tube attached to the cap closes automatically when the engine stops, the tank can be left for months without impairing the quality of the gasoline or losing any by evaporation.

CLOCK INCREASES EFFICIENCY OF RADIO-RECEIVING SET

Since nearly all important broadcasting stations publish their schedules in the newspapers giving the time of day, program detail, etc., the idea of the manufacturers of a new two-step nonregenerative honeycomb-coil receiving set to incorpo-

rate in it as standard equipment a neat clock, seems a happy one. The timepiece is set flush with the panel of the instrument, and, to radio fans within receiving

Clock Mounted in a Radio-Receiving Set, Which the Operator Watches for the Schedule Time of a Broadcast

distance of two or more broadcasting stations, this will be a welcome innovation.

Knowing the transmitting schedule of the various stations, it will no longer be necessary to keep the receiving set on-"closed circuit" for 5, 10 or 15 minutes in order not to miss a broadcast.

DRILL HOLDER WITH GAUGE FOR RAPID MEASUREMENT

For rapidly measuring the sizes of drills being manufactured, a holder that has, besides the usual holes for the drills, a long tapered slot in which the gauge of a drill can be instantly determined, is now available. Along the side of the tapered slot is a scale, graduated in thousandths of an inch, and from each point in this scale that corresponds to the number of a standard gauge, a guide line leads to the proper hole for the drill. The base is made of cast iron, but the

Drill Gauge and Holder: Drills are Measured by Placing Them in the Tapered Slot, Seen with a Scale along Its Side Graduated to Thousandths of an Inch

tapered slot is lined with hardened and ground steel.

¶A mocking bird is giving a poultry fancier of Saluda, N. C., considerable trouble by imitating the clucking of a hen and thus luring baby chicks from their mother, so that he has to chase them among weeds and undergrowth.

Off HOW LONG DOES IT TAKE

Two British scientists, Professors Joly and Poole, have recently made measurements to determine what time is necessary to arouse the sense of vision in the human eye. The apparatus used for the purpose consists of a mirror, capable of

TO SEE A THING?

Apparatus Used in Making the Tests to Determine the Length of Time Required to Arouse the Sense of Vision in the Human Eye

rotating 8,000 revolutions per minute; an incandescent lamp, so arranged that a lens focuses the filament (used edge on) upon a slit behind which is the observing eye. With the mirror in rotation the eye will receive flashes of light due to the image of the filament crossing the slit, but these flashes will succeed each other so rapidly that persistence of vision will make the illumination apparently steady. In order to deal with just one flash at a time, a revolving disk, having a sector cut out, is interposed between the lamp and lens. This disk makes about 120 revolutions per minute, and the cut-out sector is so narrow that, while the light from the lamp is passing through it, the mirror does not have quite time enough to complete one revolution. Thus the eye receives only two flashes per second, and distinctly perceives the individual flashes.

The whole apparatus is placed in a darkened room and the observing eye is allowed to remain in the dark at least 20 minutes before observations are begun, (An eye that has rested in the dark may be as much as 10,000 times more sensitive than when in a lighted room.) Knowing the width of the observing slit and the width of the image of the filament, and also the rate of rotation of the mirror and the distance of the slit from the mirror, the investigators have been able to show that a flash of .0000002 second is still visible, while a flash of a duration of .00000008 second is found to be invisible.

It is of interest to note that since the speed of light is 186,000 miles per second, the length of the beam of light entering the eye in .00000008 second is approxi-

manchester Commercial
AECHANICS 7/13/22

mately 80 feet. Assuming 50,000 waves of light to the inch, it is evident that 48,000,000 light waves register their tiny blows upon the retina during this minute interval of time.

9922 NEW FORM OF SQUIRREL-CAGE INDUCTION MOTOR

. All the advantages of the squirrel-cage induction motor, without the necessity of using a wound rotor with slip rings where a high starting torque is necessary, are embodied in a new type recently devised in Germany. The end rings of an ordinary squirrel-cage motor are cut at a number of points so that the current in the rotor has to follow a zigzag path through one bar after another instead of flowing through all the bars in parallel. This has the same effect as the slip rings, and will give about 11/4 times full-load torque with a starting current equal to twice the rated current. Centrifugal contacts close the cuts in the end rings when the motor is up to speed, and thus restore the winding to the regular squirrelcage forma-

FILLER FOR BATTERY CELLS PREVENTS OVERFLOW

To fill storagebattery cells without fear of overflow and slopping of the electrolyte. is possible with a filler having an electrical indicator that includes a tiny lamp. The appliance is affixed at the end of a small hose contains a triggerlike arrangement with which the flow of water is controlled. When a certain height liquid reached in the cell, the small lamp lights, thus enabling the user to shut off the flow and prevent any waste. By

adding of water to the battery cells is made a simple, easy, and clean task.

A Convenient Folding Drawing Table

BY EUGENE F. DAWSON

ARTISTS, draftsmen, and students of mechanical drawing, who find it necessary to do more or less of their work and study at home, will appreciate the desirable features combined in the folding drawing table illustrated. Unless

can be folded and stored away in little more space than that required for an ordinary drawing board.

When the table is folded, the legs fit snugly underneath the top, making the whole 51/2 in, deep. The legs are about

Upper Left: The Complete Table. Upper Right: Constructional Details. Lower Left and Lower Right: The Height of the Table Varied to Conform to the Posture of the User by Lengthening or Shortening the Chains That Hold the Legs Together. Center: Table, Folded

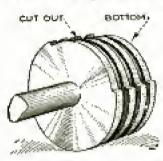

the amount of work done is great enough to justify it, the standard drawing table cannot be used, as it occupies considerable room—usually at a premium in the home. The table described, however, is light, but strong, and when not in use, 36 in, long, and are cut and hinged, 12 in, below the thumbscrew bolts, by which they are pivoted to the top.

The table top is made from an ordinary drawing board, 25 by 33 in., which is large enough for most purposes. The legs are fastened to battens with bolts and thumbnuts, the battens also helping to prevent warping of the top. It will be noted that the legs are hinged on the inner sides, and that hooks are provided to make a rigidly locked joint. The working height of the table can be varied to conform to the posture of the user, either sitting or standing, by lengthening or shortening the chains between the legs. The top can be tilted to any angle desired, by manipulation of the thumbnuts on either side.

When completely folded, the table occupies a space 33 by 25 by 5½ in.; this, together with the fact that it can be lifted and carried with one hand, makes it most convenient for the purpose intended.

Renewing Locomotive Piston Heads

A western railroad has solved the problem of renewing locomotive piston heads, which had previously been one of their most troublesome and expensive repairs. The worn piston heads are now placed

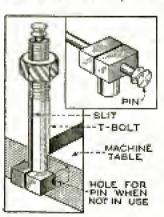

on the slotter and a small cut, generally about 1/4 in. deep, is taken across, as shown, for about two-fifths of the diameter, on the bottom side; the ribs are then filled in with brouze by

means of an acetylene torch, and the piston is made as good as new, after it has been re-turned in the lathe. The cost and delay of making a new piston head are avoided, and the time required to overhaul the engine is greatly reduced.

—A, A, Strafford, Reno, Nev.

A Handy Split T-Bolt

Most machine operators have experienced the annoyance of having to take

down all or part of an elaborate set-up in order to slide an extra bolt, the use of which has been found necessary, along the T-slot. This, of course, may happen on any machine having a slotted table, but more especially on milling machines, where an extra

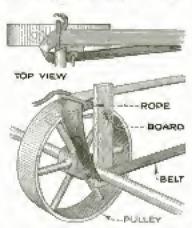

bolt is often needed and the slot is blocked at both ends. A pair of split T-bolts, such as that shown in the drawing, will make it possible to avoid disturbing the set-up in practically every case. The heads on these bolts should make a good fit in the slot. A hole is

drilled lengthwise through the bolt to take a pin, and another, of the same diameter, is drilled through the head, in which the pin is placed to hold the parts together when not in use. To insert the bolt, it is only necessary to drop the halves into the slot, slide them to a position opposite each other, and insert the pin, as shown in the drawing.

Putting on Tight Belts

The problem of how to get a tight belt onto a pulley is one that is met with in every shop at some time or another. New belts are generally cut short to allow for the inevitable stretching that takes place when in use, and, while a belt will soon accommodate itself to the length of drive, considerable force is required at first to place it on the pulley. Various devices are used to do this, but the draw-

ing illustrates a method difficult to surpass for simplicity. A short piece of rope is passed through a hole in a flat board and knotted on one side. The board is placed against the belt, and the rope

looped around the nearest arm of the pulley, then brought back and passed once around the outside of the belt and inside of the pulley, after which it is passed between the face of the pulley and the underside of the belt, and pulled tightly. When the shaft is turned, the pulley arm pulls the board around, while the belt binds the loose end of the rope tightly between it and the face of the pulley until the belt is properly placed. The board will fall away when the rope is released by the belt. Of course, the shaft should be revolved as slowly as possible.

A Novel Wire Gauge

A peculiar form of wire gauge, especially useful to electrical workers, is a card or piece of metal having mounted on it short straight pieces of wire of every size within the range desired, each size being marked with the proper number. The wires should project for a short distance beyond the edge of the card. By holding this gauge close to any other piece of wire, it is easy for the eye to pick out the wire on the card which has the same diameter as the piece to be gauged.—Curtis Ralston, Chicago, Ill.

An Oil Dropper for the Oilstone

Using kerosene as a lubricant on the modern sharpening stone makes a very fast and free-cutting tool, but, unlike the

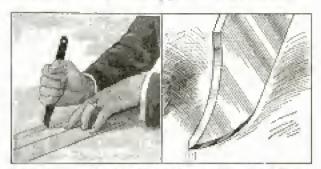

old-fashioned stone sprinkled with thick oil, fresh oil must be applied each time it is used. In most cases the oil is applied from oilcans or even open cans; this is wasteful, as much of the oil runs off the stone altogether. A certain definite feed can

be obtained in a simple manner, as shown in the illustration, where the oilstone is held on a wooden stand, and a glass bottle used to hold the kerosene. The ends of a piece of tin wrapped around the bottle are secured by a nut and screw, and the bottle is held at a convenient height, out of the way, by passing some 1/8-in. wire through a hole in the tin and bending it double, afterward driving the ends into the wooden stand. Above and below the hole in the tin, the ends are bent at right angles to form a stop that holds the bottle in a vertical position. A cut is made in one side of the cork stopper, and the feed is regulated by pushing in the cork more or less tightly. No oil is wasted by this device, as the drops fall on the center of the stone, and the oil is evenly distributed over the surface by the movements of the tool being sharpened. When not in use, the bottle is turned right side up in the clamp.

Knife for Cutting Sheet Metal

Those who have difficulty in cutting tin, or other thin sheet metal, straight and without curls, will appreciate the tool il-

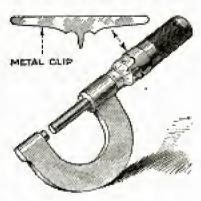

Cutting Short Metal Straight without Curls by Means of a Simple Tool Made from a Discarded Power-Hacksaw Blade

lustrated. The knife is made from a part of an old power-hacksaw blade; one end of the blade is ground as shown, and the teeth are also ground off. In cutting sheet metal with this tool, a straightedge is placed on the line to be cut, and the cutter, with its point in contact with the metal and against the straightedge, is drawn toward the body. If a single stroke is not sufficient to cut the metal, the cut can be repeated, care being taken that the point of the cutter is always placed in the same groove. When the score is deep enough, the metal can usually be separated by bending it back and forth once or twice. When the point becomes dull it can be resharpened by grinding the face.

Quick-Reading Micrometer Attachment

A circular clip, that fits closely around the thimble of a micrometer, will be found very useful when turning or grind-

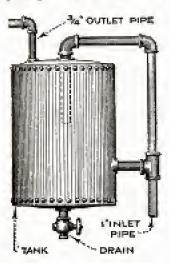

ing a number of pieces to the same size; by means of this, the mechanic is enabled to read the instrument at arm's length, avoiding the usual bending over the machine. The

clip is made of sheet metal, and is formed so that it will have enough tension to grip the thimble of the caliper tightly. The pointer is set at the proper graduation on the thimble, making the subsequent reading of the caliper a very simple matter.—Percy W. Thomas, Beloit, Wis.

Settling Chamber for Water System

At one time the water from the city mains contained so much fine sand that pump valves, washers, and other parts,

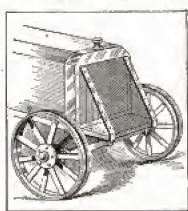

suffered considerable damage. To overcome the trouble. I tried out, with success, a simplified settling chamber. The tank used was a 100-gal. range boiler, connected to the water pipes as shown. The inlet and outlet pipes were made of different sizes, in order to reduce the force of a jet

of water entering the tank, which would have tended to keep the water agitated, and prevented the suspended matter from settling to the bottom. The dotted lines show a pipe usually supplied with a range boiler, which should be removed when the boiler is to be used as a settling tank. A valve is provided at the bottom of the tank for blowing out the sediment.—James E. Noble, Toronto, Can.

Radiator Guard for Tractor

When plowing in brush land, or fields of heavy-growth cornstalks that have not been broken down, I have several times injured the radiator of my tractor. At one time a stick about 4 ft. long was thrown by one of the guide wheels so one end caught the radiator just as the other end struck the ground. The result was that, before the machine could be stopped, a hole was made through

the radiator, breaking five of the tubes and bending many of the cooling fins. To prevent a recurrence of this, and also to prevent trash and corn husks from collecting over the front of the

radiator when cutting or husking corn, the protector illustrated was fitted. It is placed far enough ahead of the radiator not to interfere with the functioning of

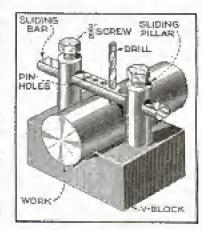

the cooling system.

Two pieces of wagon tire, 40 in. long, were bent so that the lower part extended forward horizontally about 12 in., the rest of the stock being bent at an angle to meet the top of the radiator. One end of each iron was fastened to the tractor frame at the lower corners of the radiator, and the frame covered with a piece of heavy 1/4-in.-mesh screen, attached with rivets. A board was fastened across the space at the bottom to prevent anything from striking the radiator from below. The trash which would formerly collect on the radiator and hinder cooling is now caught by the screen, and ample space is left back of this for the circulation of the air.-G. G. McVicker, North Bend, Neb.

Transferring Pinholes in Shafts

Trouble is often experienced with pinholes in worn shafts that are being replaced. Generally, only the shaft is sent

to the repairman, with instructions to make an exact duplicate, which is easy enough so far as the diameter and length of the shaft are concerned. but, should the shaft carry collars or flanges pinned to it, a mis-

take is easily made, as pinholes are as likely as not to be off center. Unless the hole in the shaft matches up with the hole already drilled in the collar, or other part to be pinned to it, the pin will not enter unless it is filed away or otherwise fitted, the result invariably being an

unsatisfactory job.

The special V-block shown in the drawing is very handy in cases of this kind, as it enables the operator to reproduce the exact position of the pinholes at once. On each side of the "V" a ¾-in. hole is drilled to take two pieces of coldrolled steel, these pieces in turn being drilled through for a piece of ½-in. tool steel. This forms a sliding bar that is flattened on the top and bottom and drilled, as shown, for standard-size pins.

The method used in transferring holes is as follows: Place the old shaft in the

V-block, the other end being supported by another V-block, or by packing; then, with the sliding bar loose, insert the drill required in the chuck, and bring it down through the corresponding hole in the bar and through the pinhole in the shaft. Tighten the screws provided for clamping the sliding bar, which is now lined up exactly with the pinhole in the old shaft; the latter is removed, and the new one put in place, clamped down, and drilled. The uprights are not clamped in any way, but are pushed down until the sliding bar touches the shaft.

Knot for Wiring Electrical Fixtures

In order to relieve the terminals of lamp sockets, etc., of the weight of the

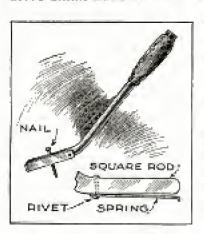

shades, the ends of the wires should be knotted as shown in the drawing. The knot should be made so that the socket cap will bear against it and support the entire weight, or strain, which prevents the connections from being pulled loose. This knot is simple, and

brings both ends of the wire out even.
It should be pulled as tightly as possible, so that it will fit easily inside the cap.

Holder for Short Nails

Cabinetmakers, and others required to drive small nails in difficult positions, will

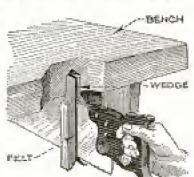

lessen the chances of pounded fingers and marred work by use of the nail holder shown in the drawing. A piece of 1/4-in. rod of suitable length is bent to the desired form. and the short end is flat-

tened on opposite sides. A piece of spring brass or steel is riveted to one of the flat surfaces, to serve as a clip for holding the nails.

A Handy Saw Oiler

Oiling handsaws before storing them away for any length of time is essential if they are to be kept in good condition and

free from rust, and if means are provided for doing this quickly and easily, the chances of neglect are materially lessened.

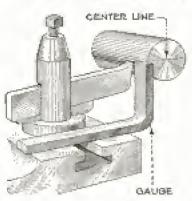

Cut two strips of pine,

1½ in, square by 10 in, long, and glue strips of felt to one side of each strip. Bore a hole in the underside of the workbench and secure the strips in the manner shown, with a wedge between them. The felt is saturated with a good grade of lubricating oil, and, by inserting the back of the saw in the slot, and drawing it back and forth several times, the tool will be covered with a thin film of oil.—G. E. Hendrickson, Argyle, Wis.

Gauge for Setting Lathe Tools

To give the best results, a lathe tool must be used with its cutting edge exactly on, or a little above, the horizontal center line of the work being turned. After years of machine-shop experience, the machinist is able to set his tool without measurement, but the beginner will find the gauge illustrated useful for setting the cutting edge of the tool at its proper height. A piece of mild steel, about 1/4

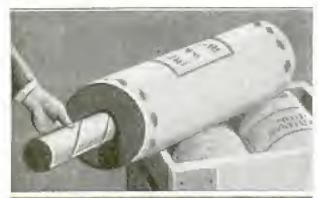

by 1 in., is bent to make a right angle, one side of which is left considerably longer than the other. The short leg of the gauge is carefully ground, until its length exactly equals

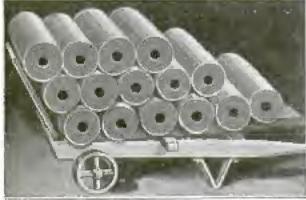

the vertical distance from the top of the toolpost block, or compound rest, to the center line of the lathe. The gauge is laid on the rest beside the toolpost, and the operator sets the edge of the tool even with the top of the gauge.—Lowell R. Butcher, Des Moines, Ia,

Preventing Rolls of Roofing Paper from Crushing

It is no longer necessary to crate rolls of prepared roofing paper for transporta-

Cardboard Mailing Tubes, Inserted in Rolls of Roofing Paper, as Shown in the Upper Photo, Prevent Crushing During Transportation, as Shown Below

tion in order to prevent the rolls from being crushed flat. One manufacturer of this product inserts two 18-in, cardboard mailing tubes into the center of each 36-in, roll of roofing paper. This arrangement has been found to give adequate protection against crushing, and as a result, the firm is able to quote more attractive prices on export shipments, because of the reduced freight charges on the product.—Chas. W. Geiger, San Francisco, Calif.

Removing Stains from Ivory

To remove brown spots from ivory, a beil glass or similar cover is required. Place some chloride of lime on a shallow dish, drop some hydrochloric acid on it, and put it underneath the inverted cover together with the object to be cleaned. The work should all be done in the open and in bright sunlight. The combination of the chlorinated lime and acid will generate chlorine gas, which should not be breathed, as it is highly irritating to the air passages. The powerful bleaching action of the gas will remove all discolor-

ations due to age and many other causes. Any spots or stains not removed by the treatment should be rubbed with a lump of tripoli, finishing with fine-powdered rouge. After bleaching the ivory in the chlorine gas, the piece should be washed in a solution of baking soda and water, rinsed in clean water, and dried with a piece of clean linen.

Replating Worn Spots

It is sometimes necessary to plate worn spots on an article so large that it would be a quite expensive item to replate the whole surface. A quick and satisfactory method of plating such worn areas is to fasten the cathode wire to the article to be plated, and the anode wire to a piece of sponge, about 2 in. in diameter. The sponge is dipped into the plating solution, the current turned on, and the metallic deposit is painted on the worn spots by passing the sponge over them. If a slight ridge is created on the line of the old and new deposits, a good burnisher should be used to work down the irregularity.

Fence Made from Discarded Porch Railing

A few years ago architectural styles demanded the addition of railings wherever they could be tacked onto a frame

The Owner of a Suburban Home Removed the "Ornamental" Railing Which Style Demanded When the House was Built, and Used It to Make a Nest Fence

house. Besides being of questionable decorative value, the railings added to the cost of painting. The illustration shows a railing which was removed from a suburban residence and used to make a fence around the yard. The square posts, being hollow, were slipped over stout stakes driven into the ground, holding the whole structure erect. Before driving, the stakes were given a coat of asphaltum paint, to serve as a preservative,—Walter C. Harris, Brooklyn, N. Y.

A Handy Drag-Saw for the Farm

By A. R. FERGUSON

MANY farmers still use the old hand methods of cutting up cordwood for storage, in spite of the fact that there are engines on their farms that can be harnessed to the work, with a very consid-

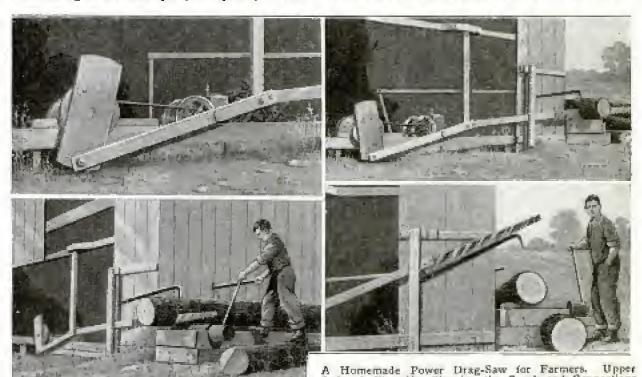

erable saving in time.

In cases where the wood to be cut into stove lengths is too large for sawing on an ordinary buzz saw, the type shown in the drawing can be builf on the side or end of the woodshed in a few hours, at practically no expense, as the materials required are usually at hand. All that is necessary for such a saw is a drag-saw blade, a piece of shafting about 5 ft. long, two pillow blocks, a pulley and flange to fit the shaft, two pieces of 2 by 8-in, plank, each 20 ft. long, and some short lengths of 2 by 6, 2 by 10, and 2

that the smallest type of farm engine can be successfully used to drive it.

The piece of shaiting referred to and its pulley are mounted on the pillow blocks, as shown in the drawing, so that the engine can be connected to it. One end of the shaft projects beyond the side of the building, and a second pulley, or a flange, keyed to the shaft at this end, will simplify the attachment of the wooden crank, which is bolted to the shaft; this arrangement makes it unnecessary to provide a steel crank.

The crank is made from a short length of 2 by 10-in. plank, fastened to the pulley or flange on the outer end of the shaft with bolts. A bolt is used for the crankpin. The distance of the crankpin from the center of the shaft will determine

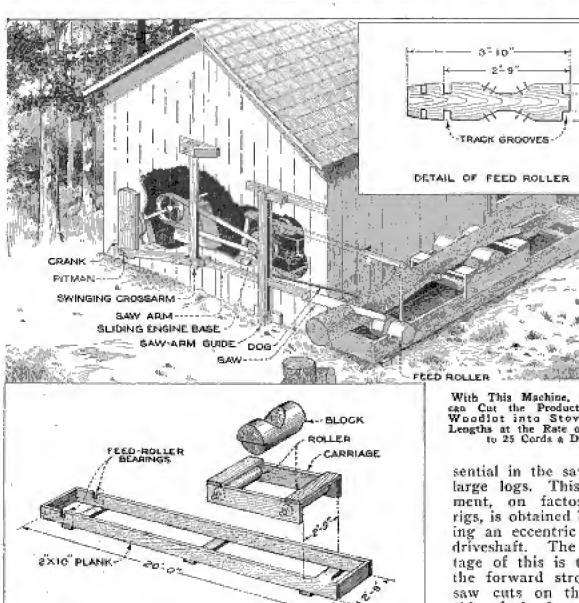

Right: General View of the Outfit. Lower Left: Dog and Saw in Position, the Saw Being Nearly through the Log. Right: The Saw and Dog Lifted at the Completion of a Cut

by 4-in. lumber. If the shafting and pillow blocks are not already at hand, it is possible that their cost can be saved by borrowing them from some of the farm machines, which, as a rule, are in storage when wood is being cut.

A common one-man saw blade may be used in place of the drag-saw, and when a small engine is used, is preferable. However, the light saw must be run slower, and given a lighter feed, or it may buckle, particularly if green wood is being cut. The machine itself has co few parts, and so few sources of friction,

the length of the saw stroke. For engines of 2 hp. or more, the proper stroke will be about 34 in., which means that the bolt used for the crankpin should be located 17 in. from the center of the shaft. Small holes are drilled through the bolt that serves as a crankpin; these are for cotter pins; if locknuts are used on the pin, these cotters are unnecessary. Steel washers should be placed on each side of the pitman on the crankpin, and between all other moving wooden parts, so that the friction of wood against wood will be reduced. The end of the pitman

farthest from the crank is supported by a swinging crossarm, as shown in the drawing. The upper end of this arm swings on a bolt in a slotted wooden bracket, fastened to the side of the building, and the lower end on a bolt in a wooden clevis, screwed to the end of the pitman. The open end of the clevis receives the end of the saw arm, which should be long enough to clear the corner of the building. Sidewise movement of the saw arm and saw is prevented by a guide placed about 3 ft, back of the corner of the the saw from dropping onto the ground. A catch can be provided for holding the saw arm in its elevated position, when a new log is being placed on the carriage, or when it is fed forward for another cut. The saw arm should just move freely inside the guide, while the swinging crossarm should not be less than 6 ft. long and the pitman about 5 ft. The sides of the clevis extend past the swinging crossarm far enough to take the saw arm; this arrangement gives the slight rocking motion to the saw which is es-

building; this guide should be long enough to allow the saw to be raised clear above the largest logs to be cut. Also, the guide should be so arranged that, when the cut is completed, it will prevent

DETAIL OF TRACK AND CARRIAGE

With This Machine, a Farmer can Cut the Product of His Woodlot into Stove-Wood Lengths at the Rate of from 5 to 25 Cords a Day

sential in the sawing of large logs. This move-ment, on factory-made rigs, is obtained by placing an eccentric on the The advantage of this is that, on the forward stroke, the saw cuts on the front side of the log, and on the back side on the back The driveshaft stroke. must revolve from left to right, or counterclock-

wise, else the sawdust will be pulled to the center of the saw cut or kerf, instead of being thrown out at the sides. Both the saw arm and pitman must be in a straight line and parallel with the side

of the building, and the shafting must be level and at right angles to the pitman and saw arm.

If the engine is a small one, a 3-hp. or less, it can be placed on a sliding base in the manner suggested in the drawing, so that by moving it backward or forward the belt will be tightened or loosened for controlling the operation of the saw. The sawyer is thus able to start and stop his saw by means of a lever extending through the side of the building and located near his post; the lever is pulled out to start the saw, and pushed in to stop it. A notch cut out of the underside of the lever forms a catch to prevent movement of the engine while the, saw is running. If the engine is too large to be moved readily by this means, an ordinary belt tightener can be used, unless a countershaft with a tight and loose pulley is available.

The carriage track is made 3 ft. wide and 20 ft. long, 2 by 8-in. material being used for the sides and ends, the other crosspieces being made from 2 by 6-in. plank. The end of the track is placed even with the end of the building; the track should be exactly at right angles to the saw, and must be level and solid. The feed roller is made from a piece of log,

about 10 in. in diameter by 3 it. 10 in. long. Its journals, or track grooves, are 3½ in. in diameter, and just wide enough to turn freely in the notches provided in the forward end of the track. The spikes are made of ¾-in. steel sharpened on each end and driven into holes drilled about 3 in. deep, after which they are hammered for another inch into the solid wood, to hold them firmly. Four large holes are drilled opposite each other in the outer end of the roller for the insertion of the bar that feeds the log forward.

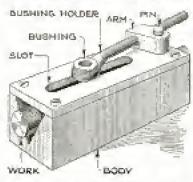

The log carriage is made as shown in the drawing, with the centerpiece saddled down to match the height of the feed roller, and prevent the log from moving sidewise; a few spikes set into the sides of the notch will prevent the log from slipping off as the feed roll is being turned. While the weight of large logs will be sufficient to prevent them from volling, the smaller ones must be held by a dog. The latter is made from a piece of flat iron, the end of which is bent at right angles and sharpened, so that it can be driven into the log; this part of the equipment is bolted to the side of the building so that it can be swung up and down as desired. It should be heavy enough to stand a good blow. "

Putting Rubber Sleeving on Wire

In electrical work, it is sometimes either necessary or desirable to slip rubber tubing over wire, in addition to the regular insulation, to make sure that there will be no short circuits. To get the sleeving on is rather difficult, as the insulation will slide along with the tubing unless the latter is oversize. One method of simplifying the work consists in waxing the insulation and heating the tubing slightly; another is to soak the tubing for a while in water, which causes it to swell enough to slip on easily. When dry, the sleeving will contract to its original size.—Frank Jablecnik, Chicago, Ill.

Self-Locking Drill Bushing for Slot Jig

In all cases where holes are drilled with their edges close to each other, the novel method of locking a drill bushing shown in the drawing will be found of great assistance. It is shown applied to a box jig used to drill the cores of boring-bar slots, but, of course, can be used in any work of a similar character. A slot is cut in the top plate of the jig, wide enough to take the drill bushing snugly. In line with this slot a pin is driven in the plate;

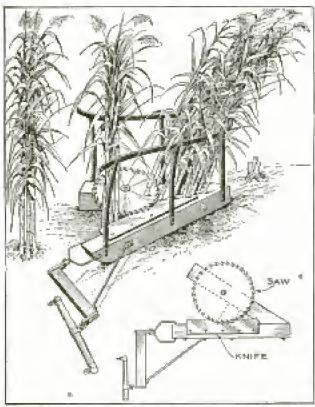

this carries a square steel arm, which in turn, carries the bushing holder, the latter being a piece of drill rod flattened at one end and drilled for the bushing.

It will be seen that, when the bushing is in the slot, it is impossible to move it backward or forward. When it is desired to change the location of the bushing, the holder is lifted, bringing the bushing out of its slot; the arm slides up the pin at the same time. The bushing holder is then pushed farther in or out of the arm, as required, and pushed down again until the bushing enters the slot. Holes can he drilled very closely together in this manner without danger of breaking through, or, if it is desired that they break into each other, no fear need be entertained that the drill will break .--Harry Moore, Montreal, Can.

A Simple Corn Harvester

The contrivance shown in the drawing was devised to supplant the slow and

A Simple Corn-Harvesting Machine, Built by a Farmer to Overcome the Tediousness of Cutting the Corn by Hand

tedious method of cutting corn by hand. A stout wedge-shaped timber frame was made, as indicated. A piece of flat steel was sharpened along one edge to form a knife, and this was bolted to the top side of one part of the frame in such a manner that about 1½ in. projected over the edge of the timber. On the opposite side of the frame an old circular saw was mounted so that it overlapped the knife for an inch or so. Discarded wagon tires were used for making the carrier, which is bolted to the frame, as shown.

In operation, a horse hitched to the device walks just outside the row, causing the cornstalks to strike against the teeth of the saw. As the stalks are carried between the saw and knife, the former revolves and cuts off the stalk, which falls into the carrier. When the carrier is filled, the stalks are removed, ready to be tied and shocked. On account of the unprotected knife arrangement, the operation of such a machine should not be entrusted to a youngster, who might become careless.

¶A tire pump can be used for blowing lamp burners.

Quick Method of Making Blueprints

In small shops, and other places where the facilities for making blueprints are lacking, the following method can be used to produce satisfactory results: Instead of making the original drawing on tracing cloth, use a piece of paraffined tissue paper which is backed up with a piece of new carbon paper. The waxed paper is placed over the carbon, so that pencil marks on it will be intensified by the carbon reproduction on the underside. The sketch is made in pencil, and the lettering can be printed in on a typewriter, still using the carbon. When finished, a print can be made from either the sketch intensified by the carbon backing, or from the carbon sheet itself, Blueprints made from the sketch will show white lines on a blue background, while prints made from the carbon copy will have a blue line on a white ground.

Coppering Brass for Laying Out

Copperplating brass with a solution of copper sulphate (blue vitriol or blue-stone) and water is not so easily done as on steel. To enable the mechanic to lay out or scribe the work so that the lines can be easily seen, scatter a light coating of steel chips over the surface to be plated, and then apply the liquid. By using this method, brass can be given a thin coating of copper as easily as steel.

Table for Computing English Exchange

The usual printed tables for computing the exchange rate of English currency can hardly be used where the rates fluctuate

POUNDS		SHI	LLINGS	PENC	E.		
- 234567 690	\$ 1.00 2.00 3.00 4.00 5.00 6.00 7.00 8.00 9.00	- 234567 690-24	\$.05 -15 -25 -30 -35 -45 -50 -60	-234567090-2	\$ -004166 -005395 -0166395 -016664 -024966 -024962 -0237496 -041682 -041682 -041682		
Useful for Qu and Acc Conve Pounds, lings	rickly urately rting	14567690	.65 .70 .80 .85 .90 .95	Pend Any chan Equi in the	Rate of Ex- ige, into Its ivalent Value Currency of		

as they have done at periods during and since the World War. The table shown berewith is good for all exchange rates, and is used as follows:

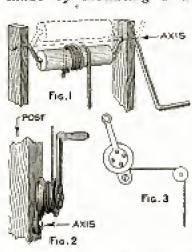

Supposing it is desired to convert £16 3s. 4d. into its equivalent in currency of the United States, and assuming that the rate of exchange is \$3.62 per pound sterling, add the totals of the following, which have been obtained by reference to the table:

£	26	ě	_		_		_	ı		_		_	į.	_	i	_			ă	ï		į,	i	L		ı.		\$1	6.00
	30.	i	-0		i				i	J	i	3	ı	ı	ı	i	÷	12	i		,		i		,	-7	ı		.15
	44.	r	i	-	ı	r	•	T	ž	-	r	-	r		-	•	-	-		-					-		r		-016664
																											**	\$1	6.166664

Multiply the sum obtained above by the exchange rate per pound sterling, or \$3.62, the result of which is \$58.52332368 or \$58.52 in currency of the United States. Any other exchange rate is used in the same manner.

A Ratchetless Windlass

A windlass or hoist that is specially handy around the farm is very simply made by mounting a wooden roller or

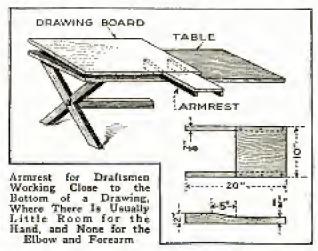

pulley as shown in the illustra tion. The wooden roller, shown in Fig. 1, is bored along the axis, an iron rod of the proper diameter driven into the hole and bent to the shape indicated, to form the axle and crank;

this rod is journaled in two posts, and the erank should be long enough to furnish the proper leverage. A hole, through which the rope is threaded, is bored through the roller as indicated. The rope cannot unwind from the roller when the latter is on the bottom center. It is true that this arrangement has a considerable up-and-down movement, but the usual ratchet is eliminated, a factor of importance when a winch must be improvised from materials at hand. The same principle is applied to the design shown in Fig. 2, in which a small pulley is used. By the use of additional pulleys, as in Fig. 3, the windlass can be arranged to pull a load in any direction, or from any rea-sonable distance.-W. G. Partin, La Grange, Ga.

■Do not tamp cinder concrete too much, as the cinders will crush and the surface to be covered by the cement will be increased considerably.

Armrest for Draftsmen

In cases where the draftsman must do a lot of lettering or fine detail work near the bottom of his drawing, there is not,

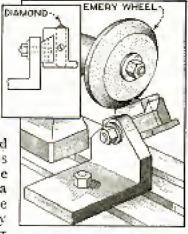

as a rule, enough space on the board for placing the hand, and no support at all for the arm. The armrest illustrated was designed to overcome conditions of this kind. The construction of the rest is amply described by the drawing, and, in use, the projecting ends of the side members are placed underneath the lower edge of the drawing board as shown,

Fixture for Dressing Angular Grinding Wheels

When grinding straight-type formed cutters, it is sometimes necessary to dress the wheel to the exact angle, irequently a difficult

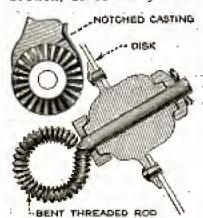

thing to do. The drawing shows a fixture for dressing the grinding wheel that can be used to produce accurate results. A hardened and ground slide is attached to the angle plate by a stud; this can be adjusted to any angle by setting with a protractor.

with a protractor from the base. The diamond-tool holder fits on this slide, and is moved back and forth on it to dress the wheel. The fixture may either be clamped to the table of the grinding machine or held on the magnetic chuck. The diamond holder is held in place by a set-screw, as shown in the insert.

Emergency Shank for Farm Implements

On farming implements using disk wheels, the shanks holding them are often broken, or so badly worn that they can-

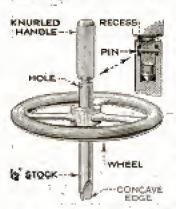

not be used. New shanks are easily made in the farm workshop, but the teeth for holding the adjustable shank tightly against the notched casting are difficult to form with the file or chisel

generally used. An easier method is to use a threading die that will cut threads corresponding as accurately as possible to the notches in the casting, and thread the end of the shank before the eye is formed. Although the threads may not coincide exactly with the notches in the easting, the parts can be bolted together tightly enough to hold.

Screwdriver for Rapid Work

The novel screwdriver shown will be found a handy tool, in cases where a large number of screws are to be turned down, as in assembling operations of different kinds. Starting the screws by hand, as usual, they can be quickly spun into place and tightened. The blade is made of

1/2-in: stock, and is ground with a concave edge. The upper end of the stock is drilled out and flat-bottomed, leaving a small center only. Next, a recess is cut near the end, and a small hole is drilled through its center, as shown. Another

piece of ½-in. stock is used for the handle, one end of which is turned down to fit loosely into the hole in the blade section. The small end of the handle is turned to a taper point, which runs in the center provided. A pin, a little shorter than the diameter of the recess, is driven into the handle and prevents the parts from becoming separated. An old valve wheel, or any wheel of suitable diameter;

is then driven tightly onto the driver section of the tool, and, if necessary, further secured by a pin. With the screws all started in one or two threads, the screwdriver is placed on each in turn, a slight downward pressure being applied on the handle; this, together with the concave edge, holds the tool in place while the wheel is given a quick twirl which sends the screw home rapidly. A slight pull on the wheel seats the screw tightly.

Double-Faced Finishing Tool

Many turning operations demand that the cut be taken to a shoulder at each end

of the work, and ordinarily a change from right to left-hand cutters is

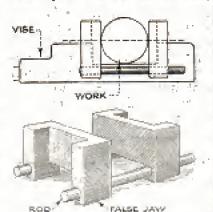

necessary, which, unless some form of a turret tool holder is used, requires a separate operation or else a delay while the operator

changes from one tool to another. In order to speed up work of this character, the tool illustrated can be used. As will be observed, the tool is made with a clearance and slight bevel from the center, thus adapting it for either right or left-hand cuts without change.—John Harger, Kaimuki, Honolulu, T. H.

Removable Jaws for Machine Vises

The narrow depth of milling-machine vises requires the use of some kind of false jaws when it is necessary to hold

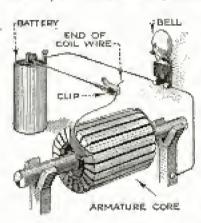

work with a bearing point above the fixed jaws; a shaft of such a diameter that the center, is higher than the top of the vise jaws is a familiar example. Removing the regular jaws

and attaching false jaws by means of screws and dowels, may take more time than the job warrants, but the removable jaws illustrated can be slipped into place or out again in a second or two. Two pieces of flat stock are shaped as illustrated, to fit the vise, and cut away in the center to allow the sides to hang down against the sides of the vise. Two toolsteel rods are then driven tightly into holes drilled in one of the jaws, the holes in the other jaw being large enough to allow it to slide on the rod guides. jaws provide a good bearing for the guide rods and are held in line by them when the vise is tightened on the work.

Testing for Electrical Grounds during Winding Operations

Even the most skilled armature or fieldcoil winder often finds, on completing his work, that the final electrical test indicates a ground. Should this ground be at the bottom of a slot, where it is difficult to repair, it may be necessary to rewind the entire job. It is quite possible to save this time and expense by testing for grounds during the winding. As will be noted, the iron of the core or field, as the

case may be, is connected electrically through a bell or low-voltage lamp to one terminal of a battery. A flexible lead, with a snap clamp attached, runs from the other battery terminal. When a

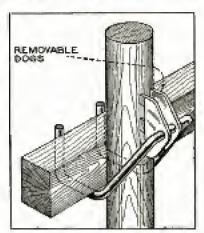

coil is about to be placed in position, the clamp is clipped to the end of one of the coil wires. By this method, if a ground is made at any time while the coil wires are being placed in the slots, the bell will ring or the lamp light. After one coil has been placed in position, the clamp is fastened to the second coil, and so on, until the job is finished. If it is not convenient or possible to use a snap clamp of the type shown, it is suggested that the battery wire be fastened to the pliers; then, when the wires are being connected or pulled into place, the grounds will be indicated as they are made.

¶A four-per-cent solution of soda and water will lighten overexposed blueprints, or will bleach them nearly white if desired; add more soda to bleach completely.

Handy Type of Scaffold Dogs

The dogs shown in the illustration will prove of value when erecting a scaffold for painters and carpenters, and for other

purposes, as they eliminate the necessity of nailing the timbers together, and yet provide perfectly secure struc-ture. The supporting arms are made of iron rod, bent to fit the 2 by 4-in, material commonly

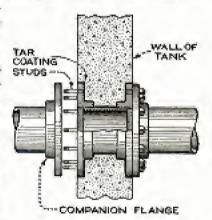

used for scaffolding. The toothed dogs are forged from steel, and bite into the uprights as soon as weight is applied. These dogs can be used with either round or square timbers.— Henry S.

Laraby, New Haven, Conn.

Water-Tight Pipe Connection for Concrete Tank

For some time, the making of pipe connections in the walls of concrete tanks has proved a troublesome problem, especially if the connection is to be made below water level, where it must be tight. The drawing shows a simple method of making a water-tight joint that can be

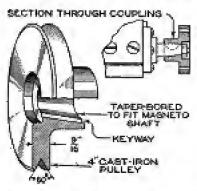

easily disconneeted, Make up a short nipple, with both ends threaded, so that the flanges can be screwed up to be flush with the inner and outer surfaces of the tank. The flanges are equipped

with studs, and the flanges and nipple should be coated with tar before assembling. It should be understood that a sleeve of the same diameter as the outside diameter of the nipple used should be placed in the form before the concrete is poured. After the concrete has set, and the nipple and flanges have been screwed in place, companion flanges are bolted in place.

Driving Pulleys for Magneto Testing

Magnetos are driven from the timing gears of an automobile engine through a coupling, and, when testing the magneto after being repaired, it is usually found unsatisfactory to drive it by running a

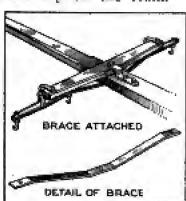

belt over this c o u p ling. Many repairmen try to use makeshift devices when testing, but the only fitting by which satisfaction can be obtained is a V-groove pulley,

the bore of which is tapered, and having a keyway to suit the Woodruff key in the shaft. These pulleys can be made of cast iron, and a set of four or five should be made up at one time. Machined all over, they will have perfect balance, this being necessary, as they must turn at high speed. As the spindles of various magnetos are different in taper as well as in size, one pulley should be made for each of the most commonly encountered types. Some of the older makes use a straight shaft, holding the coupling with a taper pin through shaft and coupling.

A Brace for Doubletrees

The tendency of a doubletree to wobble and teeter, with the tongue of the implement as a fulcrum, is always an annoyance, causing unnecessary rattle, and a hardship on the team. The brace illus-

trated overcomes the troubles mentioned, holding the doubletree steady and without interfering with its swiveling movement. A piece of old wagon tire is used for the brace.

which is bent in the manner shown. Three holes are drilled in the brace, one at each end for the clevis pins of the doubletree to pass through, and one hole at the middle for the doubletree pin through the tongue.—G. H. Glitzke, Kansas City, Mo.

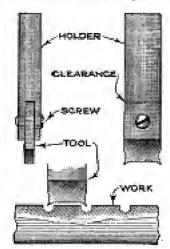

To Color Aluminum Black

A solution for coloring aluminum black is made up as follows: Dissolve 1 oz. white arsenic (poison) and 1 oz, sulphate of iron in 12 oz. hydrochloric acid, and add 12 oz. of water. The aluminum to be blackened is well cleaned with fine emery cloth and washed, before immersing it in the blackening solution. It is allowed to remain in this until the color is deep enough, when it is removed, washed in clean water, and dried in fine sawdust, after which a coat of lacquer is applied.

Cutting Keyseats in the Shaper

When no milling machine is available, the work of cutting a round-ended keyseat is awkward. Drilling a hole at each end of the keyway and cutting out the intervening metal on the shaper is the method generally adopted, but as only a very slender tool can be used, breakage is naturally frequent. If the number of keyseats will warrant, the tool and holder shown will be well worth the time spent making them. The

holder is simply a piece of rectangular stock, slotted at one end, drilled and and tapped for a longhéad screw. The tool is as thick as the width of the keyseat to be cut and as wide as the holder, as will be explained. When there assembled, should be a small clearance at the

top between tool and holder, to allow the tool to rock. The keyscats are drilled at the ends in the ordinary way, and a hole is drilled in the middle, the length of the tool being equal to the center-to-center distance of the holes. In operation, the holder is gripped in the toolpost and the clapper box blocked up. The shaper is set to a stroke slightly longer than the length of the tool, which cuts away from the center hole on both forward and backward strokes, the clearance between the top of the tool and bottom of the slot allowing the noncutting end to clear the work. It will be seen that a substantial tool can be used by this method, and that the time required to cut the keyseats is reduced to almost half that required for the older method.

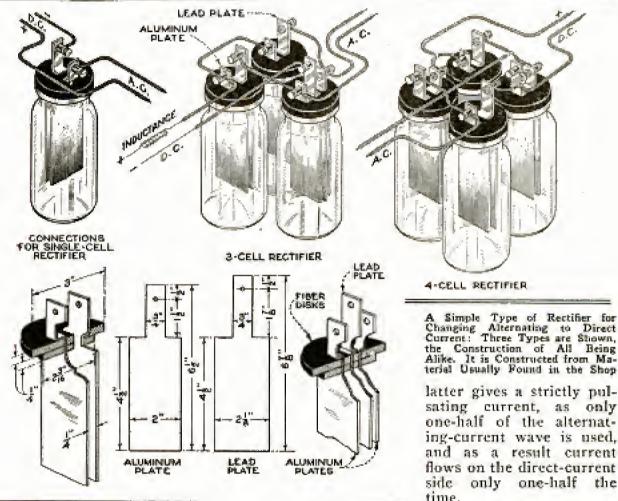

Making Electrolytic Rectifiers

BY CHAS, E. MULLIN

MOST experimenters feel the lack of direct current for recharging small storage batteries, such as are now widely used with radio apparatus; and for running small direct-current motors, electroplating, and such other purposes for which alternating current cannot be used. The residence zones of nearly all cities are, with but few exceptions, served only with alternating current. It is a very simple matter to transform the alternating-

all that might be desired from the standpoint of efficiency, but the power demand for experimental work is not usually very heavy, and therefore the technical efficiency becomes of minor importance when compared with considerations of low cost and convenience.

The rectifier here described utilizes both sides of the alternating-current wave, which makes it just twice as efficient as the single-cell type sometimes used.

current voltage to almost any other voltage, up or down, by using suitable transformers, but this does not change the character of the current. Rectification of alternating current into direct current is an entirely different matter, and is accomplished by various forms of rectifiers, or hy a motor generator, all of which are rather expensive.

For the ordinary requirements of the small-shop man, experimenter, or radioset owner, a three or four-cell electrolytic rectifier provides the cheapest and most satisfactory method of rectifying the alternating current. Such a rectifier is not ing-current wave is used, and as a result current flows on the direct-current side only one-half the time.

The three and four-cell rectifiers utilize both sides of the alternating-current wave, and, while the direct current from this type of rectifier is also pulsating in character, current is flowing through the output side practically all the time, and these pulsations may be greatly damped or smoothed by means of an inductance, as will be described later on.

Direct current produced by rectifica-tion cannot be used in place of a storage battery for radio receiving on account of its pulsating character, but may be used for recharging the storage battery if it is of small size.

Either the single or multiple-cell type

electrolytic rectifier may be readily constructed from materials usually at hand in the shop or laboratory, or which can be easily bought at very small cost. From my own experience I prefer the three-cell type of rectifier, but the four-cell combination gives a direct current that is slightly steadier. The instructions given apply to the construction of the three-cell type for use on 110-volt alternating circuits, but they may be readily adapted to either the single or four-cell rectifiers. This rectifier will give as much as 5 amperes for very short periods, but heats up under continuous service at even much lighter loads. However, by increasing the surface area of the plates, using larger jars, or by water-cooling the outside of the jars, the current capacity of the rectifier may be increased as desired.

For the three-cell rectifier the following

materials will be required:

2 pieces of sheet lead, 6% by 2 by 1/16 in.
1 piece of sheet lead, 6% by 2% by 1/16 in.
4 pieces pure sheet aluminum, 6% by 2 by 1/16 in.

in.
3 pint fruit jars.
3 pint fruit jars.
Bakelite or fiber board, about 3% or %6-in.
thick, sufficient to make three disks, 2%6 in.
in diameter, and three, 3 in, in diameter.

A good grade of sheet iron, or carbon rods or plates, may be substituted for the lead plates. The four aluminum and two of the lead sheets are cut into plates of the same shape and dimensions as indicated by the detail drawing marked "aluminum plate." The larger lead plate is formed to the measurements shown in the other plate-detail drawing. Three disks are cut to fit neatly inside the mouth of the jars, and three larger ones are provided to form covers. Ordinary wood may be used instead of the bakelite or fiber board, but it must first be boiled in paraffin, to prevent warping, and to increase its dielectric properties. One each of the large and small disks are fastened together to form single covers, and slots, about 1/4 in. apart, are cut in them; these slots should be just large enough to make a tight fit on the plate lugs. Two of the cells are arranged with one lead and one aluminum plate in each, while the third cell has two aluminum plates, one on each side of the larger lead plate. plate lugs are offset slightly, as shown in the drawing, in order to hold them se-curely in place. If desired, holes can be drilled through the plate lugs and the lugs fitted with binding screws or posts to facilitate connecting.

The mouths of the jars should be dipped into melted paraffin for about ½ in.; this will prevent the electrolyte solu-

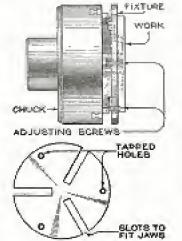

tion from "creeping." The jars are then filled to within about 1/2 in. of the top with a 5 or 10-per-cent solution of sodium bicarbonate (ordinary baking soda). The covers are then placed on the jars with the plates extending down into the electrolyte. Make certain that no two of the plates touch each other, and connect them as shown in the several drawings with No. 14 insulated copper wire. Suitable fuses and a switch should be provided on the alternating-current side, between the line and the rectifier, as a protection against accident. This switch should always be open when the rectifier is not in use.

To start the rectifier, switch on the alternating-current and close the direct-current circuit for a few minutes through about 100 ohms' resistance, such as a 100-watt lamp; this is only necessary when starting a new rectifier for the first time, but must be done in all cases, or else the device will not work,

In case a smoother current wave is desired than that furnished by the rectifier alone, an inductance may be introduced into the circuit in the manner shown. A suitable inductance is made by winding 200 or more turns of No. 16, or larger, insulated copper wire around a 1 by 1 by 6-in. laminated-iron core. Of course these inductance specifications can be changed, and the larger the core and the more turns of wire upon it, the smoother the direct-current wave will be, but this will cut down the power available.

Chucking Narrow Work

Every mechanic knows the necessity of backing up work against the chuck jaws whenever possible, as this enables heavy

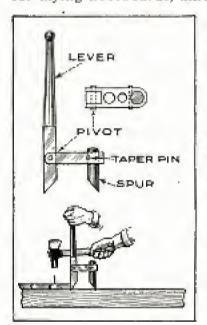

cuts to be safely taken and also greatly facilitates the setting up of the job. A handy fixture that can be instantly attached or detached to a three - jawed chuck is shown in the drawing; it is designed to be used when facing rings, . flanges, or covers that are too thin to be

backed up against the step of the chuck jaws and still allow the surface to be clear. The supporting piece is made from stock about the same diameter as the chuck, and thick enough to insure strength for the size of chuck used. Three slots are milled in this piece, 120° apart. and wide enough to form a sliding fit over the chuck jaws. Three holes are tapped in this piece, to take a corresponding number of hexagon-headed screws. When a number of pieces require to be faced, the fixture is slipped over the jaws, and the screws are adjusted until the piece is held in the proper position and is running true. The work is then held back on the fixture with one hand while the jaws are tightened. Very thin work can be securely held in this way, supported as it is all the way around. Furthermore, no time is wasted in tapping the work true, always an annoying operation on thin work and, if the job is a light casting, the danger of breakage is avoided.

Flooring Clamp

Flooring clamps of some sort are a necessary part of the carpenter's equipment for laying floorboards, unless he clings to

the primitive method of nailing a piece of 2-by-4 stuff to the joist and wedging the warped stock against the rest of the floor.

The lever part of the clamp shown is made of 1-in. square steel, and the connecting link is made from a piece of 34 by 134-in. flat stock; it is slotted at

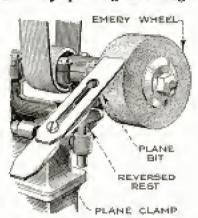

the front, for the lever, and drilled at the rear, for the spur. The spur is a piece of \(\frac{4}{3}\)-in. round tool steel, beveled at its lower end. A taper pin is used to hold the spur and link together. One or two holes can be drilled in the link in order to lighten it.

In use, the tool is brought up against the board, and the spur is driven into the joist with a blow of the flooring hatchet or hammer; this being done, pressure is exerted on the lever to bring the board into position for nailing.

Grinding Plane Bits

A practical way of grinding a plane bit at the proper angle is to reverse the plane clamp on the back of the bit and then reverse the grinder tool rest, which will serve as a guide. By placing the edge

of the clamp against the straight edge of the rest, and lowering the edge of the bit against the face of the grinding wheel, the proper bevel will be found. Then tighten down the clamp screw,

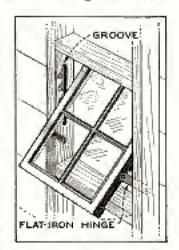

and, by sliding the bit and clamp back and forth across the face of the wheel, a good, straight edge and hollow grind will be obtained. It goes without saying, that the face of the wheel should be perfectly true.—Glen W. Noble, Jesup, Ia.

Method of Mounting Window Şash

In doing some work where it was impracticable either to slide a window sash upward or sidewise, or to hinge it at the

top and swing it to the ceiling, the arrangement illustrated was found very satisfactory. The window was hinged to two short iron straps as shown. When the window is closed these straps fit into a mortise cut into the edge of the sash. Wooden dowels, driven into the edges of the sash

a short distance above the hinges, fit into the grooves on the sides of the window casing. Notches, cut in one side of the grooves as shown, allow the window to be held open at several angles.—Rufus E. Deering, Ottawa, Kan.

(When cutters do not run true, when the work springs, or when the arbor of the milling machine is too light, wavy lines will show on the surface of the work.

Flooring Saw for Wiremen

An electrical contractor, making a specialty of wiring old houses, devised the saw shown in the drawing for cutting neat openings in the flooring. It was found that this saw saved a great deal of time

WOODEN HANDLE -GROOVED WHEEL ~ ROUND BELF SPRING BOLT CIRCULAR HOLES

and labor, and made a much neater cut than could be obtained by any other method.

A small circular saw was fastened to a % by 11/4-in. flat iron bar, bent to the shape shown and provided with a handle. A handwheel. with a groove for the round leather belt used, was fastened to the

upper part of the bar, and a smaller grooved pulley was fixed to the arbor on which the saw was fastened. This arbor was made from a bolt, and was supported and held rigid by a long bushing, forced into a hole in the supporting bar. A lug was welded at right angles to the upright bar. A similar lug was provided on the member to which the footplate was fastened, and a bolt and spring connected the two lugs. The spring was open-wound, to give it resistance to compression or expansion, as the pressure on the handle demanded. The bar to which the footplate was fastened was made of the same material as the longer one, and several holes were drilled in it for the purpose of raising or lowering the saw when cutting flooring of different thickness.

Yellow Stain in Hardwood

A troublesome defect often found in hardwood lumber is that known as yellow stain. It is usually distinguished by a pale-yellow color, generally occurs in streaks, and is detected most easily when the wood is surfaced, although it is present at times without discoloration of the wood. Its first symptom may be a moldy appearance of the wood.

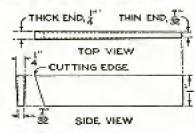

The only damage yellow stain is positively known to do, is to mar the finish of the product, since it usually penetrates the wood so deeply that it cannot be surfaced off. It is probable, however, that the fungus actually weakens the wood, and the use of yellow-stained lumber for airplane construction and similar purposes where strength is important, is to he discouraged, until a more definite knowledge is obtained about its action on wood structure,

Lumber can be protected from attack of the yellow-stain fungus by seasoning the stock without delay after it is cut, storing it in a dry place, or treating it

with preservatives.

Improving Cutting-Off Tools

The only fault that can be found with ready-made cutting-off tool bits is that there is no taper to the blade, so that clearance is only obtained at the bottom. If a quantity of such bits are on hand in the tool room, they can be taperground, to the dimensions shown, on a common surface grinder. This grinding should be done on both sides of the tool, as it is a good idea to remove the oxidized

surface of the hardened Tools steel. ground with a taper from front to back will, when set square with the job, cut

without tendency to dig, and only require grinding on the front face to resharpen them. It is best to buy the ready-made kind and regrind, as the steel used by the makers is of the best and is properly hardened and treated.

Making Concrete Bases for Steel Posts

The increasing scarcity and cost of wooden fence posts are gradually foreing the steel post into general use. It is well known that steel posts, when set in concrete, will stand firmer and last longer, but the common system of digging the post hole first, setting the post, and then filling the hole with concrete, is a slow and tedious job. I have found the following method much better: Make tubes 6 in. in diameter and 20 in. long from building paper; strengthen the splice by driving a few tacks through the double thickness of paper into a piece of lath placed on the outside. Drive the tacks from inside the tube. Place these tubes

in rows on the ground, about a foot from the barn wall and slanting a little toward Then drop a little sand or loose dirt into each tube to prevent the concrete from running out at the bottom. Place the lower ends of the posts in the tubes, leaning the upper ends against the barn wall so that they will be approximately centered in the tubes, and fill the latter with concrete. The mixture should be in the proportion of 1 part of cement to 5 parts sand. After the tubes have been filled with the cement and sand mixture, they should be allowed to remain undisturbed until thoroughly dry. When ready for use, the posts and their concrete bases can be loaded onto a wagon and hauled to their destination.—Ed Henderson, Lake Mills, Ia.

Strap Handle for Pounding Block

The common lead block, used in every shop for the purpose of pounding different materials without marking or marring, can be more conveniently handled if a leather or thick felt strap is attached in the manner shown in the illustration.

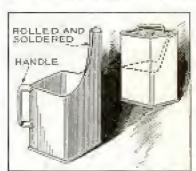

As a rule, no particular attention is paid to the shape of the block, weight being the only consideration, but it will be found that blocks molded in the end of a tube are both easy to make and handy to use. To attach the

handle, a hole is drilled through the lead, near one end, to take a stud about 1/4 in. in diameter. The strap is cut out in one piece, and one end is passed over the stud on one side, then brought over the top and over the stud on the opposite side, doubled and brought back to the first side again, leaving enough space between the parts of the strap to insert the hand easily. Then the nuts are screwed tightly. In this manner the bottom part of the strap forms a pad that lessens the shock of the blows, and the top piece enables the workman to lift the weight without gripping the sides all the time. The advantage of making the handle in one piece is that the top portion cannot fall out of an upright position.

Filling Can for Auto Engines

The breather pipe through which oil is poured into the crankcase of automobile engines is usually so located that a funnel is required when the oil supply is to be replenished, if some of the lubricant is

not to be spilled. A convenient filling can for this work can be easily made from an empty oil tin in the manner illustrated. The top and bandle of the can

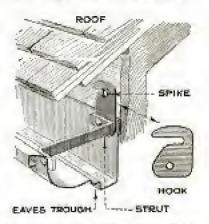

are removed, and the sides are cut away as shown by the dotted lines, leaving a section in one corner; this is rolled over and soldered to form a spout. The handle is soldered to the opposite corner, If made from a 1-gal. can, the filler will have a capacity of about one-half gallon.

Eaves Trough Made Removable

Eaves troughs can be made so as to be easily removed from the house for painting and cleaning. A great many persons are under the impression that, because the material from which the eaves troughs are made is galvanized, it will last more or less indefinitely, with little or no painting. This is a wholly erroneous and expensive notion. Painting the troughs on the building is a laborious un-

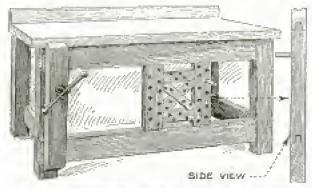

dertaking, and the work cannot be done as well from a ladder as it can on the ground. The drawing gives a clear idea of a hanger that makes it possible to remove the trough, and apply the

paint thoroughly and comfortably. The hook is made of sheet iron, and is riveted between the Z-shaped brace and the side of the trough, so that it can be swung back. If a large quantity of such fasteners is to be made, a simple blanking die could be used. A short spike, or heavy screw, driven into the side of the building, is used for attaching the hook.

An Adjustable Rest for the Workbench

The manual-training department of a school uses the adjustable work rest shown in the drawing on the work-

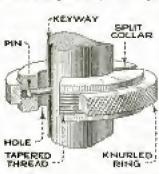

A Support or Rest for the Workbench That Accommodates Work of Any Width or Shape

benches. The rest is provided with a tongue and groove on its upper and lower edges, as shown at the right; these fit corresponding guides in the horizontal braces of the bench. The frame, or rest, is drilled with irregularly spaced holes so that work of any shape, held in the vise, can be supported by inserting pins in the proper holes. It will be noted that the groove is cut on the upper brace of the bench; this prevents its becoming choked with sawdust and other debris of the shop.—Irwin L. Morrow, Muncie, Ind.

Neat Drill-Press Stop Collar

For the smaller sizes of drill presses, the split stop collar shown in the drawing will be found much more convenient than the type commonly used, as no screwdriver or wrench is required to fasten it to the spindle. Furthermore, this stop collar presents a neater appearance and is less likely to catch the operator's clothes than the common type. It is made in two pieces, the split collar itself and a

knurled ring that screws onto it. The collar is bored to make a close fit around the drill spindle, and a slightly tapering, fine-pitched thread is cut on the circumference. The thread is turned

down on both ends, only the center portion being left, the width of this being slightly greater than the width of the knurled ring. A hole is drilled through the side of the collar for a pin that fits into the keyway of the drill-press spindle. To complete the stop, a hole is drilled through the collar, in line with the saw slot, to provide further spring, and the knurled ring is fitted. When slipped onto the spindle of the machine, the collar can be loosened or tightened in a second, the pin in the side preventing it from turning on the spindle while this is being done. Care should be taken to use a fine-pitch thread and turn down the ends to suit the narrow ring, as otherwise the collar will be difficult to adjust.

Magneto Magnets Used for Clamps

Old magnets from the magneto of a well-known light automobile, which are obtainable at garages and service stations, can be used to make serviceable clamps for bolting work down to machine tables. What magnetism there may be remaining in the parts can be removed by heating them to a bright red, and quenching in water.—J. H. Rouse, San Francisco, Calif.

Filling the Grease Gun

Filling the grease gun is a messy job, especially when one is in a hurry. A very convenient and easy way to fill the

FEL

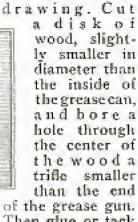

GREASE

OUN

GREASE

WOOD

cylinder of the gun is illustrated in the

Then glue or tack a strip of felt around the circumference of the

wooden disk, so as to make a snug fit inside the can of grease. By placing the disk inside the can, with the end of the grease-gun cylinder over the hole in the center, and applying pressure, the lubricant will be forced upward through the hole into the barret of the gun. The lisk can be left in the can, until empty, to serve as a cover.—Rudolph H. Kasper, Philadelphia, Pa.

How to Build a "Pushboat"

By L. B. ROBBINS

MUCH fun can be had during the swimming season with a "pushboat" of the type illustrated, which operates on the same principle as a variety of popular small-wheeled vehicles.

The hull-for lack of a better nameis made from a single thick plank, the stern end of the upright. Round off the edges so that they will not cut the legs. A mortise is cut in the upper edge of the upright, under the stern end of the scat, to receive the outrigger, and a recess under the forward end, to clear the rudder lever. A curved piece of timber, 5 ft. long,

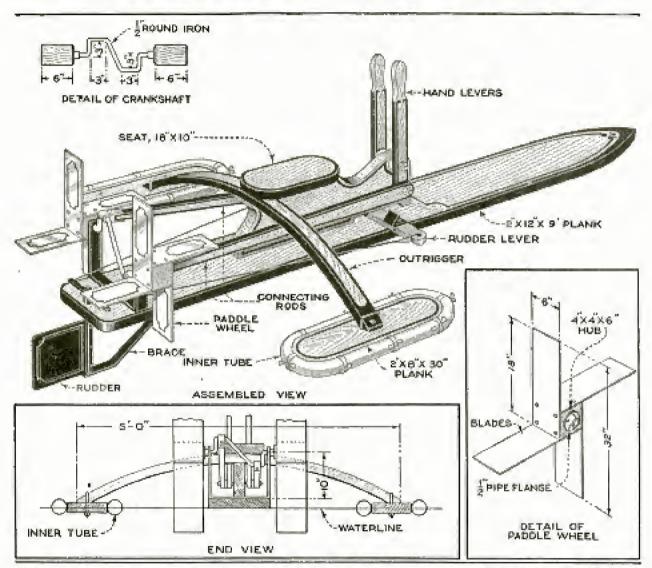

A Hand-Propelled Paddle-Wheel Water Craft of the Catamaran Type: The Back-and-Forth Movement of the Hand Levers Drives the Paddles through Connecting Rods and a Crankshaft. A Curved Out-rigger is Provided with Wooden and Pneumatic Floats on Either Side

bow end of which is pointed. After smoothing off the surface of the board, it is given at least two coats of good paint. A piece of 10-in. plank, 3 ft. long, is spiked to the deck and in the center of the hull, as shown. Then a seat, made from a 10 by 18-in. board, is nailed to the is used for the outrigger, and two roundend planks are fastened to its ends, as in the drawing. These outboard planks should be slightly lower than the hull. The outrigger is then spiked to its mortise in the upright so that the planks will be at the same distance away from the hull and parallel with it. The planks are given buoyancy by tying an inflated inner tube around the edge of each; these can be protected with a wrapping of canvas or burlap.

Movement, forward or backward, of the craft is given by paddle wheels, op-erated by a pair of levers mounted in front of the seat. The paddle wheels are made by screwing four sheet-metal blades to the sides of an oak hub, as indicated in the detail drawing. Two such paddle wheels are required, and they are attached to the ends of a crankshaft, as detailed, each end of the shaft being threaded to screw into the pipe flanges fastened to

and screwed as tightly as possible, to prevent them from turning loose by the action of the wheels in motion.

Then bolt a pair of levers, about 30 in. long, one on each side of the bow end of the upright, in front of the seat. pivot holt goes through the top corner of the upright, and should be provided with washers. Form smooth handles at the top of the levers and drill holes about 6 in, below the pivot bolt, for the con-necting-rod bolts. The levers must work back and forth freely. Motion from the levers is communicated to the paddle wheels by means of connecting rods, which are made of oak or ash. These

Detail Drawings of the "Pushboat" Which Clearly Show How the Craft is Assembled: Such a Boat Is Inexpensive to Build and can be Made Easily with Few Tools. The Outrigger Floats Make Capsizing or Sinking Difficult if Not Impossible, and It can be Driven at Good Speed in Quiet Waters

The crankshaft is the paddle wheels. supported on a U-shaped piece of heavy iron, the bearing holes being drilled 10 in. above the deck. In screwing the paddle wheels onto the crankshaft, the flange threads should be coated with white lead rods are loosely bolted to the levers in front, while the rear ends are round-notched and fitted with flat-iron bearing straps which fit around the crankshaft. By moving the levers back and forth, the paddle wheels are revolved.

Any sort of rudder can be hung from the stern and fitted with a tiller as in the drawing, so that the hands are not required to guide the craft. After completion, the whole craft is given several coats of paint to protect it from the water.

With the operator aboard, the hull will be nearly submerged, but the two inner-tube floats at the ends of the outrigger will keep it afloat and steady so that there will be no possibility of its capsizing or sinking in smooth water.

Sit facing the bow, grasping a lever in each hand and the feet on the steering lever, and then commence to pump the hand levers back and forth, at the same time steadying the rudder.

Crumbs as Lure for Fish

Fish can be attracted to the spot where the fisherman is casting, by partly filling a paper bag with bread crumbs and meat scraps, and suspending it in the water. An ordinary paper flour bag is used, and, after it has been filled, weighted, and a cord tied around the neck, it is lowered

to within about 4 ft. of the bottom, at the spot selected. Two or three small holes are made in the sides of the bag and this will start a few crumbs falling, which will attract some fish. As the crumbs are seized upon by the fish, and other crumbs continue

to fall, still more fish will be drawn to the spot. After a suitable interval has been allowed for the lure to become effective, the baited hook is let down. This method is superior to the common one of scattering loose crumbs on the water.

Violin as Phonograph Reproducer

Another of the multitude of experiments aimed at getting peculiar effects from a phonograph record, makes use of a violin as a sound box or reproducer. The bridge is fitted with a small wooden block, cut to conform to the curve; this

block should be about ½ in, square and the same length as the bridge, A phonograph needle is inserted through the center of this block, which is held tightly to

the bridge by the strings. The record is played by holding the violin so that the needle rests lightly on the disk.—H. M. Flint, Strathmore, Calif.

A Novel Corn Cutter

The corn harvester can work faster and with less fatigue when the corn cutter shown in the drawing is used, as both

hands are left free to handle the stalks. The cutter has the general appearance of a lineman's climber, although worn in a different manner. The leg iron is made from a piece of flat steel or iron. provided with

foops for straps. The steel cutter is riveted to the leg from and sharpened on the edge toward the heel.—T. S. Stuart, Indianapolis, Ind.

To Prevent Shade Tearing from Roller

It often happens that a window shade is a little short, or is pulled so far down that the tacks holding the shade to the roller are pulled out, or the cloth is torn away from them. A remedy for this

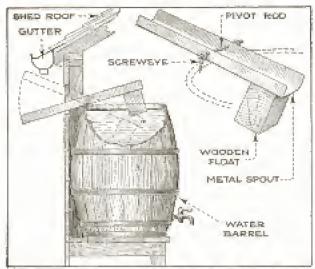

trouble consists in removing the tacks from the middle section of the shade. Two cuts, about 3

in. long, are then made in the shade, as shown; this will form a section about one-third the width of the shade, and this section is passed to the opposite side of the roller and tacked. By this method the tacks will never come into the line of pull on the last turn of the roller, and there is always enough slack to allow easy starting again.—Chas. B. Post, New London, Ohio.

Simple Water-Barrel Regulator

In order to simplify the installation of a rain barrel and do away with the inlet and overflow pipes, as well as provide an

An Automatically Regulated Rain Barrel for Storing Soft Water: When the Barrel Is Full, the Auxiliary Spout Delivers the Rain Water on the Outside

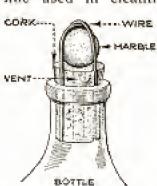

automatic method for cutting off the flow when the barrel is filled, the arrangement

illustrated was adopted.

A spout of sheet metal is pivoted to the edge of the barrel by means of screweyes and a transverse rod. The inner end of the trough is fitted, on the underside, with a wooden float so that as the barrel is filled, the float raises the spout and the water is diverted to the outside. As the water is drawn from the barrel, the outer end of the spout rises in readiness for the next rainfall.

Shaker Top for Bottles

A printer uses the device shown herewith to prevent evaporation of the gasoline used in cleaning his type of ink.

The idea is simple enough and can be applied to any vessel in which a cork stopper can be used. When the container is inverted, the marble uncovers the hole through the center of the cork so that the liquid can be shaken out

freely. When the bottle is upright, the vent is closed by the marble, effectively preventing evaporation of the volatile contents.—Howard Lindsey, Sacandaga, New York.

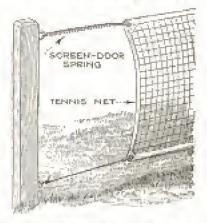

Soot Screen for Open Windows

A house cannot be well ventilated without open windows, but neither can a room
be kept clean with soot and dust blowing
in. Much, if not all, of the dirt nuisance
can be overcome by covering the window
opening with a piece of medium-heavy
muslin, stretching it tightly across the
window frame. The fabric is cut to fit
the opening when tightly stretched, allowing an inch at top and side, to which
the top parts of dress snaps or fasteners
are sewed. The fixed, or bottom parts,
of the snaps are fastened to the window
molding, close to the sash. The cloth is
then snapped into the corresponding
fasteners and the screen is in place.

Holding Tennis Nets Taut

A tennis enthusiast has attached an ordinary screen-door spring to the posts on

either side of his court for keeping the net stretched taut. A snaphook is attached to the outer ends of the springs. for attaching to the eyelets in the upper corners of the The renet. sult of this

arrangement is that the net never sags in the center, and the bother of drawing up and securing it from time to time is entirely overcome.—Chas. C. Grant, Chicago, Ill.

Repairing Carburetor Needle Valves

Failure of the carburetor needle valve to seat when depressed by the float caused an experimental temporary repair to be made, by coating the worn end of the

needle with solder. The needle had been worn so that a small shoulder had formed which prevented the tapered end from scating. When coated with solder this depression was evenly filled. Instead of grinding the

point to a seat, the valve was placed on the seat and tapped lightly into place.

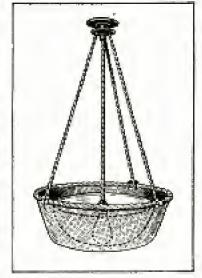

Mildew on Leather,

Any leather article is almost certain to mildew if kept in a warm, damp, and dark place, such as a closet, cellar, or stable. This mildewing will probably not seriously reduce the life of the article unless it is allowed to remain too long. It may, however, appreciably alter the color, thus injuring the appearance. The simplest way to prevent mildewing is to keep the leather in a well-ventilated, dry, well-lighted place, preferably one exposed to sunlight. When mildew develops, it should be washed off with soap and warm water, or simply wiped off with a moist cloth, drying the leather well afterward. These simple measures are more satisfactory than the application of preparations designed to prevent the growth of mildew.

A Novel Inverted-Light Reflector

An indirect-lighting fixture, which was made from a wicker basket to harmonize with the reed furniture of a room, was

provided with reflector made from a white china bowl. The handles were removed from the basket. which was suspended from the ceiling by three pieces of hemp rope, painted with gold bronze. The bowl is placed inside the basket. This suggests

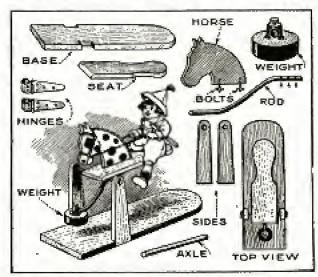

a use to which a basket with a broken handle, or a cracked bowl, may be put, as the handles are removed from the basket, and the crack in the bowl is not visible from below.

Seesaw Built for One

A single child, seeking means of entertaining itself, has a hard time in getting any pleasure out of the ordinary seesaw.

The drawing shows a combination of seesaw and rocking-horse that can be used by one child. The construction is quite simple, the dimensions and weight of the counterweight being varied to meet

different requirements. The seat is supported on an iron axle by a pair of strap hinges, one end of each hinge being bent to fit around the axle. The counterweight, which may be an iron casting, or

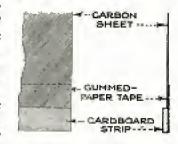

A Combination of Hobbyhorse and Seesaw That Makes It Possible for a Lone Youngster to Emeriain Himself: A Counterweight is Provided for Balancing the Weight of the Child and Seat

a block of cement, is attached to a curved iron rod fastened under the front end of the seat. The counterweight should be a trifle heavier than the combined weight of child and board, and a little experimenting will be necessary to strike the correct balance. The exact mass of the weight can be found by first attaching a bucket or bag of sand to the end of the rod, and adding or removing sand until the proper weight has been found.

A Manifolding Aid for Typists

Typewritten manifolds are frequently spoiled when the writing is carried down too close to the edge of the first sheet.

By sticking a strip of gummed-paper tape along the lower edge of the carbon paper, so that half is on the paper, then gumming a strip of cardboard to the projecting edge of

the paper strip, the arrangement will pinch between the platen feed rolls of the machine, and prevent the sheets from rising too far. Do not stick the tape to the carbon surface, and, in use, allow the cardboard to come below the edge of the sheets; just how much depends on the amount of margin desired at the bottom.

—Warren Scholl, Cleveland, Ohio.

Closet Concealed by Open Door

Occupants of an apartment in need of additional storage room noticed that a door in one of the halls was rarely closed,

The 14-Inch Space behind a Door is Used to Provide Additional Closet Room. A Set of Shelves was Built to Fit into the Space, and the Closet is Entirely Concealed by the Open Door

and as this door was hinged 14 in, from the wall, it was decided to build a closet in the space behind. The closet itself is a simple affair of two upright boards, which serve as supports for shelves. When the door is open and hooked with a screen-door hook, the closet is entirely concealed. As the shelves are not fastened to the wall, there can be no complaint from the owner and they can be removed at any time.

Lengthening the Life of Auto-Starter Gears

The constant use of the self-starter on an automobile during a period of three or four years will wear off the entering edges of the teeth on the rim of the fly-wheel, from the "clashing" contact with the steel driving pinion on the starting motor. On a four-cylinder engine, two badly worn spots will be noticeable on opposite sides of the flywheel rim, while on a six-cylinder engine there will be three such worn spots. If this wear is allowed to proceed too far, some of the teeth will eventually be broken, and may cause the complete wrecking of the starting motor.

The worn spots referred to occur between the compression points of an engine and are caused by the rotating starter pinion overcoming the inertia of the dead engine, and the sliding and grinding action of the rounded teeth before they have properly meshed with those of the flywheel. This can be stopped and a new lease of life given to the flywheel teeth by removing the flywheel from the crankshaft flanges, and shifting its position a quarter turn on the flange. This will, of course, make the valve-timing markings on the rim of the flywheel useless, and it should be re-marked. As there is no mechanical connection between the flywheel and the rest of the engine except the crankshaft, it makes no difference in what position it stands. This change is best made when the engine is taken out of the car for a general overhauling.

Rubber Mittens for Handling Brick

For rough work, such as handling brick, castings, lumber, and similar materials, damage to the hands from the sharp and jagged surfaces, or slivers, can be largely avoided by wearing mittens made from pieces of old inner tubes. A slit is cut in the side of the tube section; this allows the thumb to project, but protects the fingers and palm. It is unnecessary to close the end of the mitten, although this is easily done with a little rubber cement.—A. Swenson, Los Angeles, Calif.

Consecutive-Numbering Stamp Made from a Dater

An old dating stamp can be used to make a consecutive-numbering machine, which, while lacking the automatic and

other desirable features of the regular machine, will answer the purpose in many cases. The date numbers of two stamps can be used, one of the frames being discarded. For numbering up to 99 no change is necessary, except to remove the bands stamping the month and year.

but if numbers of more than two places are required, open up the frame of one stamp and put the numbered bands, with their changing wheels, into the other frame; this combination makes it possible to stamp numbers of four figures.

Double Horn for Autos

The alternating-current horn used on a familiar type of light automobile is not a particularly effective warning at low engine speeds. Many owners of such cars have therefore equipped them with hand-operated horns for use in emergencies.

In such cases, in order to avoid the necessity of having two separate horn buttons in different locations, the electric-horn button can be mounted on the top of the hand horn. By this arrangement, a light pressure will operate the electric horn, while, if a little more pressure is applied, both horns will be caused to sound simultaneously.—D. S. Crabtree, Bridgeport, Conn.

Washing Machine Driven by Engine in a Detached Building

A farmer makes use of the arrangement illustrated for driving the family

Using a Gas Engine Located in a Detached Building to Drive the Washing Machine in the House: Shafts Extend through the Buildings for the Best Drive

washing machine, which is located on an inclosed porch of the house, by a small gasoline engine placed in a near-by engine room. Short shafts are run from the washing machine and engine to the outside of their respective buildings, and pulleys are provided for the belt drive, which is used only on wash day.—Dale R. Van Horn, College View, Neb.

A Homemade Magazine Rack

The magazine rack illustrated will be found a great help in keeping the room tidy, and the magazines and periodicals in one place. Each side is cut from a single piece of ½-in. board. The bottom is made from two pieces of 1-in. board, and is made to slope toward the center. There is a rack across the middle of the stand for holding the books

being read or referred to by members of the family. The magazines slip underneath the bookrack, and as they lie at

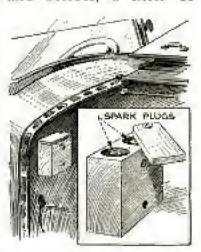

A Homemade Magazine Rack Which Is of Help in Keeping the Room Tidy and the Periodicals in Nest Order

an angle, one can easily read the titles and remove the publications desired without disturbing the others.—C. L. Meller, Fargo, N D.

Container Saves Spark Plugs

Extra spark plugs are often carelessly thrown into the toolbox, with the result that the jack, pump, or other implement is dropped in on top of them, breaking the porcelain, and besides, a litter of

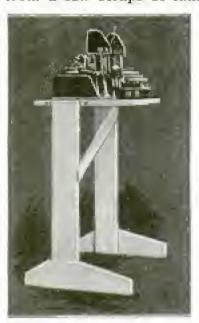

tools must be "pawed over" to find the plugs, when needed. A container similar to the one illustrated saves its cost by protecting the plugs against damage, and makes them instantly available. Á wooden block,

2 by 4 in. in cross section, and of suitable length, has two 1½-in. holes drilled in it, is fitted with a swinging cover, and fastened to the engine side of the dash. This container carries two spark plugs, and affords them ample protection.

A Simple Typewriter Stand

The illustration shows how a substantial typewriter stand can be easily made from a few scraps of lumber. The table

consists of two legs with long feet at the bottom, a top for the typewriter to rest on, and a brace across the legs. If the table is assembled solidly, using screws instead of nails, it is ouite substantial. It is also neat in appearance and can be finished to harmonize with

the other pieces of furniture.—R. E. Deering, Ottawa, Kan.

Instrument Knobs Made from Storage-Battery Plugs

The radio fan who is pressed for eash while building his set can save a little by making his own instrument knobs from old storage-battery plugs, which can be obtained for little or nothing at almost

any battery station. There are two types of such plugs; those with an outside or male thread, Fig. 1, and those built like a cap, with internal or female threads, Fig. 2. The former are the easiest adapted and are stronger than the latter. Two meth-

ods of attaching the screws to the knobs are illustrated, although others will readily suggest themselves. In most cases it will be found easiest simply to center the screw in the cap and fill the cavity with melted battery-scaling compound, sealing wax, or asphaltum.

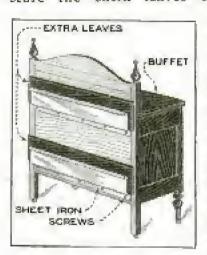

¶Your radio questions, if sent to our Bureau of Information, will be answered by an expert.

Testing Lubrication of an Auto

A lubricating difficulty that shows itself by burning out the front connecting-rod bearings and scoring the cylinder of a light automobile, is caused by clogging of the oil-feed pipe that carries oil from the flywheel to the forward end of the crankcase. As a test, to determine whether the oil pipe is open, in cases where the engine shows symptoms of trouble from this cause, it is only necessary to remove the right-hand crankcase-cover screw and start the engine. A stream of oil issuing from the open screw hole will remove any doubt of the oil feed being clogged. If desired, this screw may be replaced by a small petcock which can be opened while the engine is running.

Storing Extra Table Leaves

It is sometimes quite a problem to the housewife to know where she can best store the extra leaves of the dining-

room extension table, so that they will he out of sight and at the same time readily accessible; the drawing shows how one housewife solved it. Pieces of sheet iron. about 6 in. wide, were bent to the

shape shown; holes were drilled along the lower edge for screws, and the upper edge was slightly curved outward to prevent scratching and marring the finish of the leaves. These brackets were then screwed to the back of the buffet. The leaves drop easily into place without moving the buffet; as the baseboard prevents it from coming close against the wall, there is generally plenty of room for the leaves.

Chain for the Clothes Closet

A piece of light chain, stretched taut between the walls of a clothes closet, is fine for holding coat hangers. The hooks of the hangers can be caught in the links so that there is no danger of their sagging together at one point, as they do when a cord, wire, or pole is used.

A STEAM BOILER FOR
MODEL ENGINES

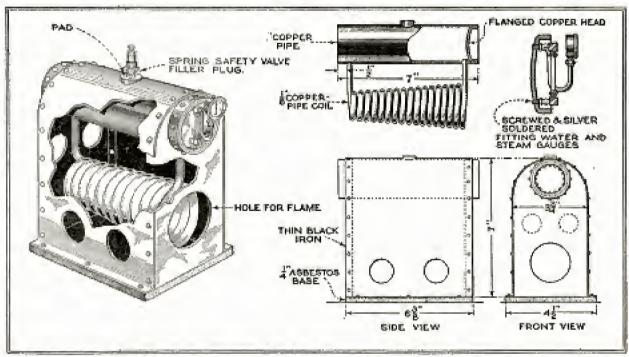

By D. M. RICE

MODEL steam engines, of either stationary or marine types up to 1/4 horsepower, can be successfully operated by the miniature boiler shown in the drawing. Such a boiler is designed to be heated by a blowtorch, which makes it possible to generate the working pressure of steam in a very short time; by varying the design slightly, an alcohol lamp may be used under the copper coil, which will also give good results.

The boiler is a simple affair, although a little skill will be required to form the convex heads; these are made from disks of sheet copper, ½ in, thick and 2¾ in, in diameter. The disks are beaten hollow

in. in diameter, and a convex face, that will fit neatly into the hollowed disk, turned on one end. A small hole is drilled in the center of each disk, and they are then fastened, one at a time, to the end of the rounded block with a small wood screw. The copper is hammered lightly along its outside edge, turning it down parallel with the sides of the block until a nicely flanged boiler head is obtained. After the heads have been flanged in this manner, the small hole in the center is stopped with a rivet and covered with solder.

The boiler shell is made from a 7-in. piece of copper or brass tube, 2 in. in

A Miniature Boiler for Model Steam Engines of Either Stationary or Marine Types: The Boiler is Heated by the Fisme from a Gasoline Blowtorch Directed through the Center of a Coil of Copper Pipe Attached to the Underside of the Shell

with a light ball-peen hammer, or pressed out in a simple die. The depth of the hollow should be about ¾ in., and, if the hammer is used, care should be used in beating the metal to see that the strokes are not so heavy that the thickness of the metal will be reduced. After the proper convexity has been given to the disks, a piece of hardwood is turned down to 1¾

diameter. Drill a hole near each end to receive the ends of the copper coil, as shown. On the opposite side of the shell, rivet or braze a small metal disk, or pad, about 1/8 in, thick. This pad should be filed on its underside to conform to the curve of the boiler shell, and is necessary for attaching the safety valve, as the metal of the shell is not thick enough to

permit tapping the threaded hole. A safety valve is absolutely necessary. No provision is shown for the steam outlet of the boiler, as this may be located to suit different conditions, but a pad, similar to the one described for the safety valve, must be provided for the steam pipe. Although the steam outlet may be placed in various positions, it is, in all cases, necessary to place it above the waterline, and standard practice should be followed by placing the steam pipe on top of the boiler.

The spiral copper-tube heating coil should next be made and fitted to the holes provided for the purpose on the underside of the boiler shell. About 9 ft. of copper tubing, with an internal diameter of 1/8 in, will be required for this coil, which is wound around a piece of rod or pipe 1% in, in diameter. The mandrel is placed in a vise and 21 turns of the tubing are made around it. The coil will be improved if it is tapered, as shown in the drawing, although this is not essential. The ends of the completed coil are fitted into the holes provided in the underside of the boiler, in such a manner that they project about 1/4 in, on the inside. The ends of the coil should be well brazed or silver-soldered to the inside of the 2-in. pipe forming the boiler body.

When everything else has been done in the order and manner described, the heads, which must be left to the last, are fitted into the ends of the boiler shell and fastened with rivets. The easiest way to do the work is to fasten both boiler heads with the flanges out and with their convex faces toward the center of the shell; this arresigement makes it possible to rivet both heads from the outside with soft-iron rivets. After the heads have been riveted, both the rivets and the seam between the flange and boiler shell should be well sweated with silver solder, or brazed, to insure an absolutely steamtight job and increase the strength.

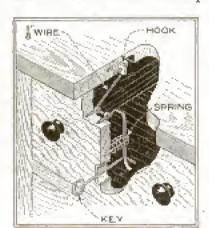

The water glass and steam-pressure gauge, which should form a part of the boiler fittings in all cases, are screwed into holes tapped in the front boiler head, and then silver-soldered or brazed.

Very little description is required for the boiler setting, which, as shown by the drawing, is made of sheet iron, fastened to an asbestos-board base.

After completing the setting, the boiler is ready for testing. After unscrewing the safety valve, fill the boiler and coil to within ½ in. of the top with water; replace the safety valve and set it at the desired pressure, which should, in no case, exceed 50 lb. If the steam pipe has not yet been connected to the engine, remove it from the boiler and screw a plug into the steam outlet. The boiler should be heated slowly the first time, by applying the flame of a gasoline blowtorch through the hole in the front of the casing. Any small leaks which may be detected can be brazed, or stopped by calking.

Simple Lock for Drawer or Chest

A simple lock for a drawer or chest, that will make it impossible for anyone not in the secret to open the drawer

without resorting to force, can be made in a few minutes.

A piece of stiff wire is bent to the shape shown in the drawing and fastened to the inside of the drawer case with screweyes. A piece of

spring wire is wrapped around a rod to make a compression spring, which is slipped over the staple provided for the stem of the lock; this spring locks the drawer automatically when it is closed. A hook, bent on the upper end of the wire, fits into a slot cut in the underside of the chest top; the front of this slot is fitted with a brass wearing plate, against which the hook bears. The lock is opened by a bent-wire key, inserted into the keyhole and turned until the bent end comes over the stem end of the lock, which is pulled forward.—A. K. Harrison, Chicago, Ill.

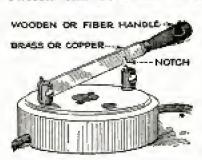

Mounting of Shade Allows Top and Bottom Ventilation

There are occasions when it is desirable to admit light or air from the top of the window, which is impossible with the ordinary arrangement of the window shades. A simple method by which this is made possible is to mount the shade roller across the middle of the window opening. The blind is removed from the roller, folded in the middle and tacked on again at this point. This arrangement will make it necessary to hem the plain end so

that a stick or rod can be inserted. A weighted cord from the upper end of the blind passes over a pulley, or through a screweye, in the top of the window frame, and serves to hold the shade taut. The curtain is operated from the bottom of the window, as usual, but when the lower half of the blind is pulled down, the upper part will be pulled toward the top by the weight, and when the lower half is rolled up, the upper section will also be wound around the roller. An arrangement of this sort makes it possible to ventilate a room from the top as well as the bottom of a window.

Knife Switch Made from Old Snap Switch

When snap switches become so worn that they are beyond repairing, a knife switch can be made from the porcelain

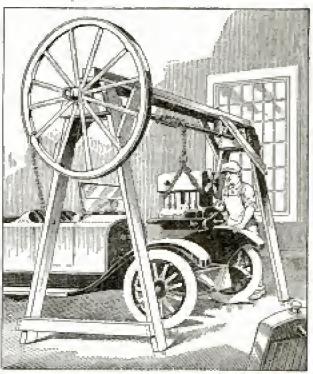

base and terminals that remain after other parts have been removed. Such a switch will prove quite an acceptable article in experimental

work. The old center of the original switch is removed and discarded, as are also the spring clips on each terminal. A piece of brass or copper, about 3 in. long, is made into a switch blade, and provided with a wooden or fiber handle. A hole is drilled at the end for the terminal screw, and a notch is cut in the edge just back of the handle, to fit over the terminal screw on the opposite side. Slots must also be cut through the center of each terminal, for the switch blade,

Repair-Shop or Farm Hoisting Gear

For hoisting automobile engines from their chassis, lifting bodies, and other heavy work, an automobile repairman uses the hoisting arrangement shown in the drawing. The main structure is of wood, with a piece of heavy 3-in. pipe supported on wooden bearings, parallel with the horizontal crosspiece. An eyebolt, to which one end of the hoisting chain is attached, is fastened to the center of the pipe. An old wagon wheel is pinned to the outer end of the pipe and provides a means for turning the pipe and winding up the chain. This arrangement produces a powerful leverage. A holdfast for retain-

ing the hoist in any position is provided by a short chain and hook fastened to the woodwork, the hook being slipped over one of the spokes in the manner shown.

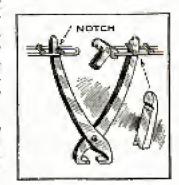

This Simple Windlass Arrangement Consists of a Wagon Wheel Pinned to the End of a Piece of Heavy Pipe, Which is Supported on Wooden Bearings

Iron straps, in addition to the bearings, are provided, for supporting some of the weight of the load on the pipe. The usefulness of this device is not confined to the shop. It will be found exceedingly handy around the farm, for lifting wagon tops, or other heavy work.

Applying Auto-Tire Chains

Automobile users are familiar with the trouble encountered in applying a set of antiskid chains tightly enough to prevent

them from coming off the tire or striking the fenders. The drawing shows how the ends can be fastened together with the tire-chain repair pliers, which should form a part of the car's tool equipment. A notch is filed on

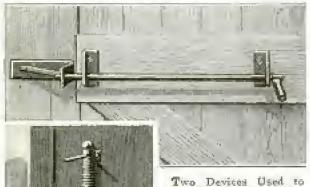

the inner side of each of the handles, which are inserted into the chain links as shown. The handles of the tool are then pressed together and the fastener hooked.

—George Elleson, West Allis, Wis.

Holding Garage Doors Open

All manner of devices are used to prevent the garage doors from blowing shut while the car is in the opening; the two

Two Devices Used to Prevent Garage Doors from Blowing Shut When the Car Is in the Door Opening: The Upper One Holds the Door to the Wall, White the Other Engages in a Hole in the Floor

shown in the illustration, however, have the merits of strength and case of operation. One is an all-

metal fastener, which requires an angle iron fitted to the outside wall of the garage, but which works independently of the ground and floor. Instead of a simple hole in the angle iron, it is better to make a vertical slot to allow for sagging of the door. The other, a lighter fastener, consists of a piece of hardwood curtain pole, with a coil spring, to keep it up when not in use. When the door is to be held open, the rod is pushed downward, so that a metal pin driven into the lower end engages in a hole in a small block of cement which is imbedded in the ground. A pin in the top of the pole catches into a notch in an iron plate, when pushed down to hold the door; the other end of this pin forms a handle for swinging the rod around, to release it from the notch.

The Use of Lacquers

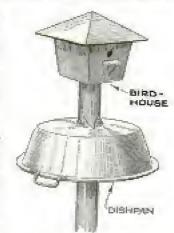

There are two kinds of lacquers on the market—dip and brush. A dip lacquer is made in such a manner as to give the best results when the articles are dipped in it. Brush lacquers are intended to be applied to the work with a brush, and do not give satisfaction when used for dipping. To produce the best results it is necessary to use a lacquer that is made especially for the kind of metal on which it is to be

used. As a general rule, brass lacquer is colored yellow, while one used on silver articles is colorless. Lacquers should not he rubbed onto the work, like paint, but should be flowed on, like enamel, so as to obtain as smooth a finish as possible, without brush marks showing. After the work is done, all the brushes should be wiped on old newspapers until they are as dry as possible, cleaned with turpentine, and put away where they will not accumulate dirt.—W. S. Standiford, Youngstown, Ohio.

A Dishpan Cat Guard for Birdhouse

To protect birdhouses and feeding tables from the raids of cats, an effective guard can be made from an old dishpan. The pan is turned

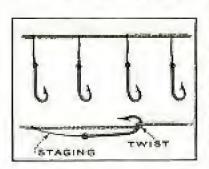

The pan is turned bottom up, and three slits are cut in the center, the metal between the cuts being turned back to form ears, by means of which the device is nailed to the pole. When the birdhouse is protected in this manner, a cat or other marander cannot reach the top of the pole

top of the pole and disturb the bird residents or visitors. —L. B. Robbins, Harwich, Mass.

Taking Up a Trot-Line

When taking up a trot-line, the usual result is a bad tangle of hooks and line,

which is difficult to avoid unless the staging is removed entirely. The drawing shows a method that entirely overcomes the trouble. Each staging is

pulled tightly along the line, and the cord is given a single twist around the hook. After all the hooks have been treated in this manner, it is a simple matter to wind up the whole line without danger of tangling; when the line is set again, all the hooks will be in place and there will be no snarls.

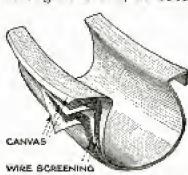

Cleaning Auto-Starting Gears

The pinion and driveshaft of the starting motor on most automobiles are usually neglected by the owner until the day comes when they refuse to turn over the engine.

The usual symptom of a dirty drive is the humming of the starting motor, without the engine being cranked, when the starter button is pressed. This is caused by dirt or even heavy oil getting on the driveshaft, and preventing the pinion from screwing out and meshing with the teeth on the flywheel. Generally, it is only necessary to remove the floorboards to expose the starter pinion and flywheel, and then wipe off as much dirt as possible with a clean rag. If a blowtorch is at hand for spraying gasoline, it can be used to clean the driving mechanism thoroughly. Gasoline applied with a brush will also remove all accumulated dirt and gum. After the gasoline has evaporated, oil the mechanism with a small quantity of very light oil. This part of the car should be cleaned at least once a year.-G. W. Greene, Madison, Wisconsin.

A Long-Lived Blow-Out Shoe

Most blow-out shoes, when used inside a tire, have a tendency to blow out through the tire, as soon as one or two

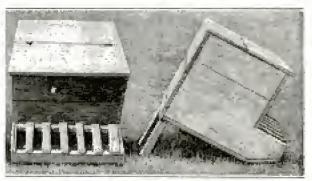

layers of the fabric have been worn through. This trouble was overcome, in one instance, as follows:

Two thin blow-out shoes were laid together,

with a layer of steel screening, which is somewhat finer than common screen wire, between them. The wire layer was held in place by sewing it to one of the shees with waxed shoe thread, after which the two shoes were cemented together. The edges of the shoe that projected under the tire were fastened together at several points with split rivets. This reinforcing was found to impart superior wearing qualities. Later a homemade patch was made, along similar lines, from three layers of heavy canvas with a layer of wire between them, as shown in the drawing, the whole being comented together, to prevent creeping.

Self-Feeder for Poultry

Every poultry raiser or farmer who keeps poultry knows the advantages of a self-feeder, and the pictures show how

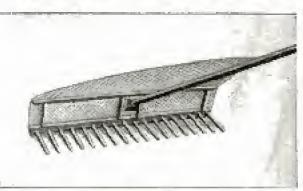

Front and End Views of a Poultry Feeder That can be Made at Little or No Expense: The Back is Elevated So That There will Be a Constant Supply of Feed at the Front

such an article can be made from an old hox or scrap lumber. This feeder is 2 ft. wide, 2½ ft. long, 2 ft. high at the front and 2½ ft. at the back. By elevating the back in the manner shown, there is always a constant supply of feed at the front, which is not always the case if the feeder is set level.—H. J. Eugel, New Braunfels, Texas.

An Improved Leaf Rake

A rake which is especially useful for raking leaves from the lawn is shown in the illustration. It can be made from a

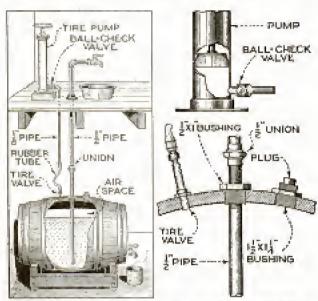

A Rake Which does Not Dig into the Ground Is Especially Useful in Cleaning a Lawn of Dead Leaves

common wooden rake, which has one edge planed to a slight bevel; on this edge is built a light framework to carry the handle, as shown.

The bevel throws the teeth slightly downward, so that the points just touch the ground. To prevent the accumulated leaves from flowing over the back of the rake, a piece of wire netting is tacked over the frame, a section being brought over and fastened to the handle.—H. N. Posz, Winona, Minn.

Dispensing System for Oils and Other Liquids

A country resident bought his kerosene oil, for illuminating and cooking purposes,

An Oll-Elevating System, Used by a Householder to Draw Off Supplies of Kerosene for Domestic Purposea: It can be Applied to Good Advantage in Garages and Shops

by the barrel, and kept it stored in the basement. In order to make it convenient to draw a supply of fuel from the barrel without descending to the basement, the arrangement illustrated was used to raise

the oil to the upper floor.

A sound, tight barrel was set in a wooden cradle and three holes were drilled in the top of the vessel. The one in the exact center of the bilge was 7/8 in. in diameter, another hole, 6 in. to one side of the center was 1% in, in diameter, and another on the opposite side of the center was made small enough to accommodate an ordinary tire valve. The large holes were threaded for reducing bushings, as shown, the 11/2 by 11/4-in, bushing screwed home, and a plug screwed into it. plugged hole was used for filling the har-The discharge line consisted of a rel. piece of 1/2-in. pipe, 6 in. longer than required to reach the bottom of the barrel. One end of this pipe was threaded for a distance of 8 in, and the I by 11/2-in. reducing bushing screwed on, so that the threaded end of the pipe projected at least 6 in. above the flange. The pipe was inserted into the oil barrel to within an inch of the bottom, and the bushing screwed home. A tire valve was threaded into the smallest hole, all joints and threads being coated with white lead to insure tightness, The oil was conducted to the upper floor by the piping arrangement illustrated. Air pressure was used to elevate the oil to the outlet and this was provided by means of an ordinary automobile tire pump. A ball-check valve was connected to the base of the pump to prevent escape of the air. The pump stirrup was then bolted to the floor, and the air outlet conducted to the tire valve on the barrel as shown.

In use, the barrel was never completely filled, an air space of about 2 in, being allowed in order to create pressure. Then, when oil was desired, a few strokes of the pump created the necessary pressure to raise the fuel when the stopcock upstairs was opened. About ½ lb. of air pressure should be allowed for each foot the oil is to be raised.

Miteless Poultry Roost

A piece of 2 by 2-in, material is molded as shown in the drawing, with a semicircular groove. A strip of wood, about

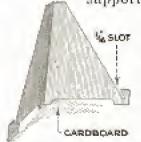

¼ in. thick and wide cnough to cover the cavity, is glued into a recess cut in the top, as shown. This leaves a covered chan-

nel which extends to within 1 in. of the ends of the roost. The groove is filled with kerosene from time to time, and this effectively prevents mites from reaching the fowls. The pores of the wood will soon become saturated with the oil, and none of the parasites will go near the roosts.

Easel for Showcards and Photos

By using a triangular piece of cardboard, a neat and inconspicuous easel for supporting photographs, show-

cards, and similar articles, can be easily
made. The cardboard
is folded in the center.
and, if heavy stock
which is liable to
break, is used, a strip
of muslin can be glued
over the crease. Slots

are cut into projections left on the bottom corners, and care must be used in cutting these, to prevent the projections from breaking off. In use, the article to be displayed is placed in the slots, after the easel has been bent.—Eugene O. Blessing, San Francisco, Calif.

A PORTABLE RADIO RECEIVER

By F. L. BRITTIN

BOY scouts and other outers, who desire a portable radio-receiving set that has a receiving and tuning range beyond the usual crystal-detector instruments, will find that the single vacuum-tube apparatus described in this article meets their requirements. Honeycomb inductance coils are used so that the set can be tuned to any damped or undamped wave length between 200 and 15,000 meters.

At the outset it should be understood

that no restriction is placed on the ingenuity of the individual builder, in adding features or refinements that he may deem necessary or desirable, and the dimensions given for the panel and other parts may be altered in any way to suit the available space. The original set was built into a school case, which is a miniature suitcase, having inside dimensions of 51/2 by 111/2 by 141/2 in. The bakelite

panel is set in ½ in, from the edge of the open case, so that there will be plenty of clearance for the knobs and switches when the cover is closed.

The panel is held in place inside the case against ½-in, square wooden strips and the edge of the wooden partition. Small brass hinges are used for hinging the panel to the lower strip, and a cabinet catch is placed at the top; this arrangement makes it possible for the operator to swing the panel out at will, to get at the circuit or back-mounted instruments. The remainder of the space, at the right of the partition, is divided by shelves into

compartments for the B-battery, honeycomb inductance coils, and headset. The
upper shelf is for the B-battery, which
may consist either of 10 three-cell flashlight batteries or a standard unit; if
flashlight batteries are used, they should
be taped together with friction tape, connected in series, and tapped off to the
B-battery switch on the panel. Small
flexible lamp cord is used for the battery
connections, and these are led through
holes drilled in the partition. The middle shelf holds the

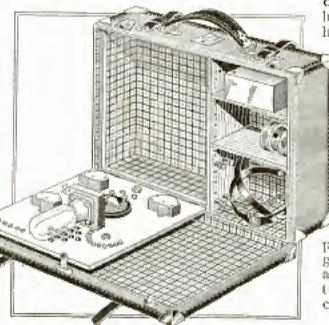

dle shelf holds the honeycomb coils; holes are drilled in

the shelf to take the plugs, so that the coils are carried upright, and without rattling. The telephones are carried in the bottom compartment, free from possible knocks and jars, on a piece of felt glued to the bottom. The

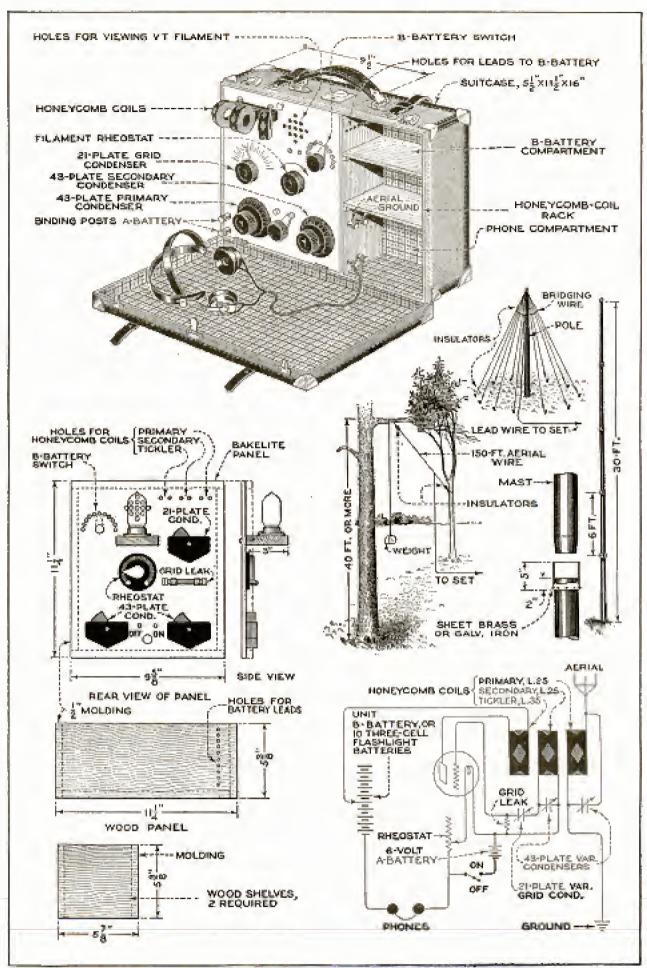

phones, aerial, and ground binding posts are shown on the partition in the phone compartment.

The necessary instruments can be mounted in various ways, but the arrange-

ways, but the arrangement shown in the drawing is a very neat one, with the two 43-plate condensers and switch at the bottom, the 21-plate condenser and filament rheostat in the middle, and the B-battery switch holes for viewing the vacuum tube, and inductance at the top. The 43-plate condensers should have a capacity of ,001 mi. each. The 21-plate grid condenser should have a capacity of .0005 mi. The honeycomb inductances are mounted on a standard mounting unit, which allows the coils to be swung back and forth to vary the coupling; these coils must, of course, be removed when the case is closed. A

Panel Let Down Flat, Showing Back-Mounting of the Condensers, Rheostat, and Vacuum-Tube Socket

A Small Vacuum-Tube Radio Receiver for the Use of Boy Scouts and Campers: With the Proper Coils, the Wave-Length Range Is from 200 to 15,000 Meters. Two Types of Aerial, with the Method of Erecting, are Shown in the Right Center

standard 2-megohm grid leak is placed just above the switch, and the vacuum tube is mounted on a standard base, screwed to a wooden block that is fastened to the panel with two screws; tube sockets for mounting directly to the panel are available as an alternative to the method described. The wiring is No. 16 rubber-covered fixture wire; all joints should be soldered, and no more wire used than is absolutely necessary. The binding posts for the A-battery are shown in the lower left-hand corner of the panel; this battery is for lighting the filament in the VT-tube and four or five ordinary dry cells will answer, or, if an automobile is handy, the necessary current can be drawn from the storage battery. The phones should be wound to at least 2,000 ohms' resistance. In buying the several instruments for the panel, get short, flat knobs for the condensers and rheostat; for space is at a premium, and this should be kept in mind throughout the assembling of the set.

The simple wiring circuit is clearly

shown in the drawing, and, if carefully followed, will give excellent results.

The best outdoor aerial is a No. 14 copper wire, or stranded phosphor-bronze wire, 150 to 200 ft. long, with a small insulator (not porcelain) at each end. A piece of light rope, with a weight fastened to one end, is tied to one of the insulators and thrown over the limb of a tree as far as possible above ground, care being taken to have an open space free from obstruction for stretching the wire. The other end of the aerial is tied to another tree, about 5 or 6 ft. from the ground, and a lead wire to the set is soldered in place.

The umbrella type of aerial shown is generally used in the army signal corps for field work, but is more complicated. The wires are brought out from a common point from the top of the jointed mast and staked out from insulators. A 6-it iron rod driven into the earth makes a good ground for both types; if a stream is near by, the end of the ground wire can be weighted and submerged.

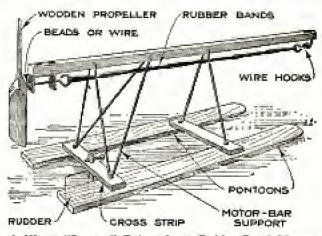

Warming Up the Auto

When starting up the car on a frosty morning, or at any other time after the engine has become cold, when there is a persistent popping at the carburetor, and lack of power in the engine, a simple expedient is to place a piece of newspaper over the front of the radiator. The suction of the fan will hold the paper against the radiator, and, after a few minutes of running, the engine will attain normal operating temperature.

Making a Toy Water "Scooter"

The drawing shows a water "scooter" that can easily be made by the average boy from a few bits of light board, some stiff wire, and a handful of rubber bands. The pontoons are tapered at the stem of the craft and are held the right distance apart by cross strips. The propulsive mechanism of the scooter is mounted overhead. The propeller is the most difficult part to make, and possibly some experimentation will be necessary to get the most effective result; however, the important thing to remember is, that it must be balanced accurately and lined up well to insure smooth running. It is mounted on a wire shaft supported by a tin bracket, but before assembling the propeller in its bearing, a few beads or a few loose turns of wire should be slipped over the shaft,

as indicated, to provide clearance. The actual power is furnished by a long rubber strip, or a number of rubber bands looped together, the rubber strip thus ob-

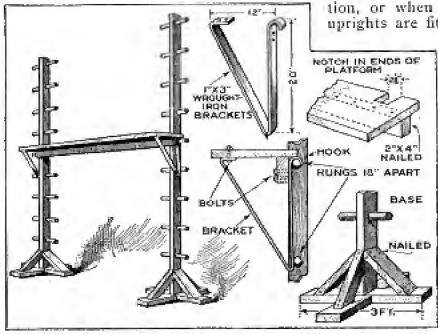

A Water "Scooter" Driven by a Rubber-Band Motor, That can be Easily Made from Light Strips of Wood, In Capable of Good Speed for Voyages That Average About 50 Feet

tained being dusted with talcum powder and fastened, at one end, to the propeller, and at the opposite end to the overhead wooden strip, as shown. Powerful rubber bands can be cut from an old inner tube. If desired, a rudder may be added to the boat so that it can be made to travel in a circle instead of a straight line. Such a scooter, lightly constructed and with a sufficiently powerful rubberband motor, will travel at good speed for about 50 feet.—D. W. Clark, Buffalo, N. Y.

An Adjustable Portable Scaffold

A portable scaffold that is light in weight, simple in construction, and readily

A Portable Scaffold That Is Light Yet Substantial, and That can be Adjusted to Varying Heights: The Uprights can be Used Separately, as Ladders, When Necessary

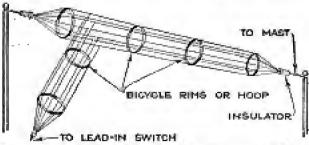

adjustable, is made in the manner indicated in the drawing.

The scaffold uprights are built of 2 by 4-in, lumber, and can be used individually as ladders for setting the horizontal section, or when moving it higher. These uprights are fitted with rounds of 34-in.

pipe or 1-in. oak, about 9 in. long, and the 3-it. crossbars at the lower ends make the scaffold as stable as the usual ladder. The platform is a 12-in, plank with a 2 by 4-in, piece nailed near one edge, as indicated in the drawing. Wroughtiron brackets, provided with a hook at one end to catch over the projecting rounds of the uprights, are bolted to the ends of the platform, and, notches are provided in it, to fit around the uprights, and prevent the platform from shifting sidewise,-G. A. Luers, Washington, D. C.

New Type of Cage Antenna for Radio Stations

The cage type of aerial is gaining considerable favor with commercial and amateur operators, as it is easy to construct, economical in the number of insulators required, eliminates much trouble due to poorly soldered joints, occupies less space, and offers less resistance to the wind than the old flat-top type. Height is essential in this type, as the lead-in is also of the cage type, which adds to the capacity of the aerial. With this kind of antenna and lead-in it is possible to get greatly

The Cage Type Aerial is Highly Recommended to Amateurs, as It Is the Most Efficient Type for Stations Operating on a 200-Meter Wave Length

increased range of radiation on 200 meters. A good ground system is required, and good results cannot be obtained without giving as much attention to the ground-

ing as to any other detail of the transmitting equipment. Either a suspended counterpoise or buried ground should be used, the latter being formed by burying 60-ft. lengths of No. 14 hare copper wire in the ground, the wires being laid to radiate fanwise under the aerial. This size bare copper wire is also used in the construction of the cage aerial, and a long insulator is used at each end of the cage; the spreaders or hoops are made of heavy wire, or discarded bicycle rims, which are light and strong, can be used, the separate wires forming the cage being secured to the hoops by several turns of wire, and then soldered. The ends of the wires are brought together, carefully soldered, and fastened securely to the insulators. The lead-in wires are soldered to the cage wires, and too much emphasis can hardly be placed on the necessity of careful soldering, as loose joints greatly reduce officiency. All guy wires should be "broken up" with small insulators. The masts that support the acrial should both be of the same length so that each end of the aerial will be the same distance from the ground.

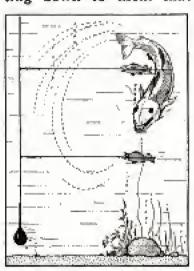

¶A small lump of sealing wax can be used to take the place of broken type-writer keys.

Bathing-Cap Ornaments

The ordinary soft-rubber bathing cap may be decorated with designs and monograms cut from the cementless rubber-patch material that forms a part of the equipment of practically every motorist, or which can be obtained for a small sum. The design is penciled on the stock, then cut out with a pair of sharp scissors or a knife, and applied to the cap in the same manner as when patching a tire.—Harold McMahon, Hatchville, Mass.

Trolling Rig for Autumn Lake Trout

Lake trout strike best in the autumn, and the drawing shows a method of getting down to them that will commend

itself to the angler. This fish as well as others, such as the walleyed pike, are found in deep water, and unless the lure is dropped deep no results are obtained. The main line is weighted at the bottom with an 8-oz. pear-shaped dipsey. The

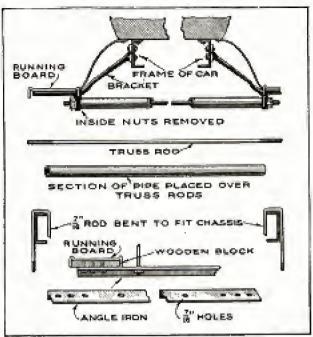

branch lines are connected to the main one, at intervals of about 4 ft., by swivels, which prevent kinking and twisting. The minnows are fastened to the double hooks in the manner shown. The bottom depth is now found and the surface point marked on the line, so that the fisherman can troll some 3 or 4 ft. off the bottom.

Overcoming Sagging Running Boards

The tendency of the running boards of a light automobile to sag down can be largely prevented by reinforcing the brackets by a horizontal brace underneath the car.

Referring to the drawing, it will be seen that a suitable length of pipe, placed over the truss rods, can be used to make a substantial brace and prevent bending of the running-board brackets—the real cause of sagging running boards.

A more substantial method, and one that gives greater rigidity, involves considerably more work, justified, however, by the results. A piece of stiff angle iron is holted to the running boards, a hardwood block being interposed, as indicated,

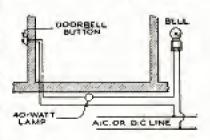

Two Systems of Reinforcing the Running Boards of a Light Car to Prevent Sagging: The Braces Also Permit the Carriage of Additional Weight on the Running Board

as a bearing for the ends of the brace. Two iron hooks are formed like the ones shown; these fit over the side channels of the chassis, with the threaded ends fitting into holes in the brace; they are drawn up tightly and locked with a castle nut and cotter pin.

Using Bell on Lighting Systems

The drawing shows a method by means of which an electric doorbell is rung by current from the house-lighting system,

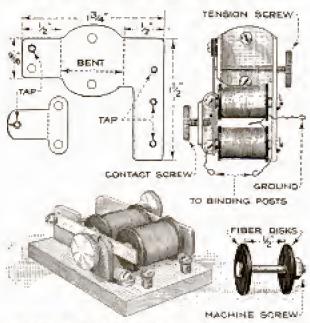

without the use of a transformer, the necessary reduction in the strength of the current being obtained by the interposition of a 40-

watt lamp in one side of the cell circuit. The advantage of this over the usual dry-battery system is apparent, and, while the voltage at the bell or button is not heavy enough to be dangerous, the bell should be wired with fully insulated wire, such as used in the wiring of the lighting system, instead of the usual thinly insulated bell wire.—W. A. Duncan, Toronto, Ontario.

A High-Tone Radio Buzzer

A buzzer with a clear, high-pitched tone is very desirable for radio-testing purposes, but, while it can be bought,

Operated by a Flat-Type Flashlight Battery, This Miniature Buzzer Produces the High-Pitched Tone So Desirable for Radio-Testing Purposes

such instruments are usually large, and cannot be used with a flashlight battery without exhausting it quickly. The homemade buzzer illustrated, however, is very small, and is particularly designed for

flashlight-battery service.

The magnets are wound around cores made from 6-32 iron machine screws, 3/4 in, long, the hexagon heads of which are filed round. The spool ends are made from fiber disks, %6 in, in diameter, and holes are drilled through them to make a tight fit on the screws. A space, 1/2 in, long, is left between the disks for the winding, which is of No. 32 insulated wire; No. 30 wire, which is a trifle larger. can also be used, if necessary. Wind the space between the disks full, and, when finished, bring the ends out through small holes drilled in the disks, as shown. Then solder together the ends of the wires that begin the winding. One of the outside wires is grounded to the metal frame, and the other is connected to a binding post.

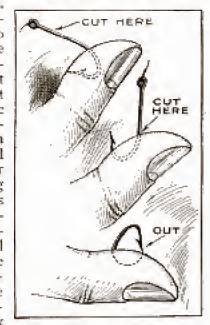

A piece of fairly stiff spring steel is used for the vibrator, which is mounted on the frame with a screw and two small washers. The tension screw merely presses against the vibrator. Contact points from spark coils, either new ones or old, which can be obtained for the asking at almost any garage, are soldered to the vibrator and the contact screw.

A piece of thick sheet brass or iron is cut to the pattern shown; then the necessary holes are drilled and tapped as indicated, a %2-in, tap being used for the threads. The screw holes at the center of the frame can be made to any con-venient size; these holes are for the screws that fasten the instrument to its base. The bracket for holding the contact screw is made from a separate piece and mounted independently. After the hole for the contact screw has been drilled and tapped, a slot is cut through the bracket, and the ends squeezed together a little, to make a tight fit on the screw and prevent it from working loose. After all holes have been drilled and tapped, the frame is bent up as indicated by the dotted lines. Two binding posts are used for connecting the wires to the coils and contact-screw bracket.--Harry L. Gray, Independence, Ia.

Extracting Fishhook from Flesh

There is little that frightens a person so much as running a fishhook into the

finger or flesh. The first impulse is to withdraw the hook by working it out at the point it entered; the barb, however, sticks in the flesh, and causes more or less suffering before it is finally removed, if removed at all without the aid of a physician. A simple method of taking out a hook

is illustrated in the drawing. In the upper example the shank of the book is cut at the point indicated and instead of working the book out the way it entered it is pushed out as shown in the bottom drawing. When the barbed end of the book is pushed out of the flesh, cut the shank again at the point shown in the middle drawing, take hold of the barb with the pliers, and turn it out; then cleanse the wound and apply antiseptics. For this as well as other purposes, the fisherman will find a small pair of wire-cutting pliers a useful article.

PRIZE OFFERS AND ANNOUNCEMENTS

46 NATIONAL FEDERATION OF MUSIC CLUBS' EIGHTH PRIZE COMPETITION

The National Federation of Music Clubs announces its eighth prize competition for American composers. Prizes of from \$1,000 to \$100 each are offered for compositions of 10 different classes. The contest is open to all American citizens, except the violin solo which is open only to native-born Americans, preferably a woman. All compositions must be submitted before Dec. 15, 1922. Address, Mrs. Edwin B. Carrigues, Room 201 Bellevue-Stratford, Philadelphia, Pa.

PRIZES FOR THE BEST LIAISON SYSTEM

Nothing is of more general interest to the army than an efficient means of liaison between the infantry and its supporting artillery. Up to the present no entirely antisfactory system has been evolved, and, therefore, to encourage its study, the American Army and Nasy Journal is offering prizes of \$160, \$50, \$25, and \$15 for the best stories on the subject. For particulars address that journal at 354 Fourth Ave., New York City.

FOR THE BEST SYMPHONIC COMPOSITION A PRIZE OF \$1,000 WILL BE AWARDED

For the encouragement and recognition of American composers, the proprietors of five of the largest moving-picture theaters in Chicago are offering a prize of \$1,000 to the writer of the hest symphonic composition submitted to them before Jan. 1, 1923. The five competing compositions considered next in order of merit will be performed by the Chicago Theater Symphony Orchestra at their Sunday noon concerts. The contest is open to all American citizens. Address, Balaban & Katz, 173 State St., Chicago, Ill.

LEGITIMATE INVESTORS INSTRUCTED

BY A STOCK-EXCHANGE PLAYLET

BY A STOCK-EXCHANGE PLAYLET

Published by the New York Stock Exchange to show the way to safe and legitimate investments, ignorance of which has so often made investors the victims of fraudulent promoters and brokers, is a playlet entitled "Smith's First Investment," The play is a dramatization of a typical legitimate investment transaction. Copies can be obtained free by addressing Committee on Library, New York Stock Exchange. change (I have the more

IS AWARDED SELECTED LIBRETTO WHICH IS NOW READY FOR COMPOSERS

The winning librettist in the \$1,000 lyric-dance-drama contest offered by the National Federation of Music Clubs, in which \$400 goes to the librettist and \$600 to the composer, has been announced. Robert Francis Allen, of Coleraine, Mass., is the winner, Copies of the libretto will be ready for distribution among composers at an early date, and may be secured from Mrs. Edwin B. Garrigues, 201 Belleype-Stratford, Philadelphia, Fa.

QUEBEC TO REWARD LITERARY EFFORT IN ANNUAL COMPETITIONS

To encourage the production of literary or scientific works in the province of Ouchec, Can., an act of the legislative assembly provides that the sum of \$5,000 shall be appropriated annually for the establishment of a fund for literary and scientific competitions. This initial amount of only \$5,000 will be increased if the results of the competitions show justification for such action.

9 98 SATTLESNAKE CATCHING PURSUED POR PROPIT AND PASTIME

There is no accounting for taste, but it is hard to realize how a man can be actually found of handling rattlesnakes. Such a man, by the name of Ed Metgrer, but more generally known as "Captain

Permangande of ameared over wow

Snakes," for 10 years did nothing else but catch venomous reptiles in Texas and Mexico. During a period of nine months he is said to have captured 17,000 snakes, most of them rattlers. Though he has learned to do this work with little risk to himself, he has nevertheless been bitten 29 times by rattlers, and his body bears evidence of the fact by the number of scars on all parts of it. These bites have done him no harm; in fact, he claims that in one case the bite cured him of rheumatism. He neutralizes the snake's venom with permanganate of potash, which, he says, is an infallable antidote. He does not do this work for the fun of it alone, for he sells the snakes to zoos and shows, and to scientists. zons and shows, and to scientists.

PRIZES OFFERED IN SEARCH FOR OLDEST U. S. FARMERS

Search was recently made through a novel kind of prize contest, which closed August 10, for the oldest man and the oldest woman living on farms in the United States. Blanks were jurnished which the venerable contestants filled in with their names and ages, and evidence that they lived on farms. The winner got \$50 in gold and a free trip to the Central States Pair and Exposition, at Aurora, III,

33 ONE THOUSAND DOLLARS IN PRIZES FOR MUSICAL COMPOSITIONS

To stimulate the citorts of composers, a prize contest has been instituted by the Etude Music Magazine. There are offered 24 prizes for piano and vocal mathems and part songs. The contest of the contes solos, and for authems and part songs. The contest is open to composers of every nationality, and will close Dec. 1, 1922. Address, The Etude Prize Contest, 1712 Chestnut Street, Philadelphia, Pa.

THREE PRIZES OFFERED FOR BEST PHOTOS SUBMITTED TO A MAGAZINE MONTHLY

For photographs judged to be the best of those submitted during each calendar month, three prizes of \$15, \$10, and \$5 are awarded by the magazine Motor. The photos must not have been published elsewhere. Address, 119 West 40th Street, New York City/3

FOR A NAME TO REPLACE "SILVORE" VALUABLE PRIZES ARE OFFERED

For a name to replace "Silvore," the present name of silverplated ware made by the Seymour Manufacturing Company, it offers prizes to the value of \$2,000. For conditions of the contest, address the company at Seymour, Conn.

WINNER OF CONTEST FOR HOTEL MEN

Open only to "Greeters" in good standing, a prize contest is announced by Hotel Management, the winner of which will be given a free trip to Europe and return. While abroad, the winner will be guaranteed a position with pay at one of the best hotels in Paris. The winner of the contest will be the Greeter who, before April 1, 1923, sends to Hotel Management the largest number of business-promoting ideas that are acceptable for publication in the magazine. Address, Greeter Contest Editor, Hotel Management, 342 Madison Ave., New York City.

FOR BEST 50-WORD BUSINESS CODE

Prizes amounting to \$225 for a 50-word business code are offered by the Farm Mortgage Bankers Association of America. The first prize will be \$150, the second and third \$50 and \$25. The first 10 pages of the 1922 directory of the association, on file in all public libraries, will farnish the facts needed as a basis of the code. The contest closes Sept. 18, 1922. Address, Contest Committee, Farm Mortgage Bankers Association of America, 112 W. Adams Street, Chicago, III. cago, III.

LATEST DEVELOPMENTS IN SCIENTIFIC, RESEARCH

189 LIFE YIELDS A PEW OF ITS SECRET

The study of the action of narcotics and other drugs, The study of the action of narcolics and other drugs, and of the perception of such and taste, has given information of fundamental importance respecting the character of living matter and assisted in solving many of the secrets of life; and from the information already gained, new and valuable drugs have been produced, and the future may yield a means for composition, and the future may yield a means for com-

already gained, new and valuable drugs have been produced, and the future may yield a means for combating mosquitoes and like pests.

At one time it was suggested that after all, life was only a matter of chemistry, and that when the facts were found, all its processes could be represented in a series of chemical equations. It is of interest to note, however, that in recent progress made in this field, chemistry plays a smaller and smaller part in the ideas as knowledge proceeds. In the old conceptions, which appears quite natural, it was supposed that the actions of poisons, nescotics, and the like, were the result of chemical reactions. It appears now that effects of similar nature can be produced by substances of markedly different chemical nature, and that their action denembs to an important exten upon whether or not they penetrate readily the walls of the living cells. In fact, the matter appears to be one more of playsics than chemistry; and the size, arrangement, and conditions of the components of the cell, and the presence of a relatively large amount of surface determine match of the nature of bring tissue.

Studies in this field have made threefold progress: first, in firsting our more and more about the processes of life and its true nature; second, in the creation, so to speak, of new drugs that have the benefits of old mean without many of their disalvantages. For interact, surgery now possesses means for obtaining local mostlessia by reasonts which were sought for

ones without many of their disadvantages. For in-counce, surgery now possesses means for obtaining local anesthesia by reagents which were sought for and found as the result of a definite theory to illumi-mate the way. The same ideas and processes have already led to the production of not only new and valuable drugs of a more or less predetermined nature, but new perfumes, new antiseptics, and new flavoring materials. The third development yielded by this method of research is the recent production of re-pellents for insects, one of which is a substance effective against the body losse. Similar work may yield the discovery of repellents for house thes, mos-quitoes, and flow. Thus this study, far from being a

matter of only academic interest has resulted in achievyments of the most practical importance in everyday No. 86 44

NEW ANALYSIS OF HEARING DISCOVERED BY LABORATORY EXPERIMENTS

Record experiments on the sensitiveness of the ear to somais of different pitches have yielded information of both theoretical and practical importance. It appears that, in people with defective hearing, there is a very definite connection between the peculiarities of their deafness and the results obtained by experiment. In the experiments the intensity of a pure tone in a telephone receiver is varied by moving a slider along a wire. The slider is set at the point where the subject is just able to perceive a faint sound. By repeating this for a number of pitches, it is possible to construct a corve showing the relation between the ensitiveness of the ear and the pitch of the sounds. Perceptible differences were found to exist even in normal ears, but in cases of detective hearing, characteristic curves were obtained which are quite dis-

Perceptible differences were found to exist even in normal ears, but in cases of defective hearing, characteristic curves were obtained which are quite distinctive. It appears possible to employ these curves for diagronsing the nature of any particular case of deafness, and to show and record the progressive development of the disease. For instance, in middle-enrologment of the disease. For instance, in middle-enrologment, the hearing may be pearly mornal for high pitches but deficient for low tones. For deafness arising in the inner ear, defective hearing begins for a high pitch and may not extend to the low ones. In acrve deafness, where the totaled arises not from any mechanical fault in the car parts but in the nerves themselves, total deafness may exist for some range of pitches, and this may be surprisingly promotioned. In one such individual, a sound of 200,000,000,000 times the energy required to be heard by the normal ear failed to produce a sensation, though sounds of less than 1.600 deathle vibrations were second could be perceived. The experiments also indicate that the ear acts like a complex efectical or nechanical vibrating system, and no definite frequency can be assigned to any one member of it. These results have an important bearing on the theory of bearing, and will help solve many questions which have here puzzling the scientists for many years.

As if across a desk

"New York is calling!" says the operator in San Francisco. And across the continent business is transacted as if across a desk.

Within arm's length of the man with a telephone are seventy thousand cities, towns and villages connected by a single system. Without moving from his chair, without loss of time from his affairs, he may travel an open track to any of those places at any time of day or night.

In the private life of the individual the urgent need of instant and personal long distance communication is an emergency that comes infrequently—but it is imperative when it does come. In the business life of the nation it is a constant necessity. Without telephone service as Americans know it, industry and commerce could not operate on

their present scale. Fifty per cent more communications are transmitted by telephone than by mail. This is in spite of the fact that each telephone communication may do the work of several letters.

The pioneers who planned the telephone system realized that the value of a telephone would depend upon the number of other telephones with which it could be connected. They realized that to reach the greatest number of people in the most efficient way a single system and a universal service would be essential.

By enabling a hundred million people to speak to each other at any time and across any distance, the Bell System has added significance to the motto of the nation's founders: "In union there is strength."

A tap with a hammer sinks the jaws in the wood close to the pail.

Then rap the bevel to close the jaws on the sail.

And pull it like this. Could anything be simpler?

"It's no job to pull nails with this nail-puller," says Mr. Punch

"It looks like a mighty handy little tool—this Pocket Nail-Puller does. It's small enough to go into a pocket or a nail-pouch, and it's cheap enough so any man can afford to own one. And every carpenter, regular or amateur, can find a lot of work for it.

"You know there's two ways of doing a job like opening a box. One is to knock the top off, breaking a chisel and splitting the cover in the process.

"The other way is to use a Goodell-Pratt Pocket Nail-Puller, and save your tools and your feelings—and maybe save the box so you can use it again."

This Pocket Nail-Puller is a regular one of the Goodell-Pratt 1500 Good Tools.

And Mr. Punch says, "An honest tool is like an honest friend; they both stick it out to the end."

Write for free illustrated pocket edition catalog describing the Goodell-Pratt 1500 Good Tools. You'll find much to interest you in it.

Do not delay writing for our big free catalog which will be sent FREE for the asking, as we want you to realize that this is the best and biggest typewriter offer ever made.

"Have Yet to Discover Anything Which Differs From a New Machine"

I have used many Underwoods in my time, and I have yet to discover anything about this machine which differs in the least from a new machine. In fact, I would still be in hoppy ignorance if some anserupulous person had cold me the machine as a new one, at the price of a new ene.

E. J. QUINNY,
May 3, 1922. Bound Brook, N. J.

"Rather Write With This One Than Any New One I Have Ever Used"

New One I have Ever uses

It is impossible to tell from its appearance that it is a Rebuilt mechine, and
it is every bit as good as anybody could
expect it to be. I have written on several new Underwoods, but I would a
great deal eather write with this one
than any new one I have ever used,
WILBERT QUACK,
April 11, 1952,
Mt. Vernon, O,

ONLY

The Proposition

One of America's largest woolen mills-Taylor-Wells & Co.—for the first time in the history of woolen mill merchandising has decided to manufacture all wool products overcoats, work-pants, bed-blankets, autorobes, raincoats and suits—every one of superb quality, fashioned from their own woolens, to be sold directly from the mills to the wearer. An organization of special representatives is now being formed to represent Taylor-Wells & Co. in exclusive territory. In view of the fact that this organization is to be composed of the best grade of men we can secure we are going to be mighty particular about—

The Man

He need not have selling experience. But he must possess loyalty, honesty, sincerity and a good reputation in his community. We do not want every Tom, Dick or Harry. We want men of whom we will be proud—and who in turn will be proud of us and our merchandise. We know our merchandise to be of the highest grade and we want men of a like calibre.

His Earnings

Conservatively estimated a special representative should earn from \$5000 to \$7000 a year. The demand for our product will be great. Selling direct from the woolen mills to the consumer-we can sell **all wool** products at a price so low as to be astonishing. Our representative will practically build business for himself in his territory. Customers who buy Taylor-Wells all wool merchandise stay customers.

His Future

The sales organization now being formed is in its infancy. Within a short time District Managerships will be open. The men who join us now—and who "make good"—place themselves immediately in line for a District Managership which should not him \$10,000 a year and more. The ambitious man with the determination to succeed will have no trouble in "landing" one of these openings.

This may be your one big opportunity! Do not delay! Write us immediately for full details of this amazing opportunity. Territories will be going fast—so if you believe yourself the "right man"—hurry.

The Midget "FIVE-IN-ONE" Slide Rule is a consistent in Manushelm. Log-Log, Add and Subtract, Polyphase and Dinary Slide Rule. It will instantly add, subtract, multiply and allule any combination involving whole analogs, fractions, desirable and singly analogue. Give every possible root and rower of every quantitie. The graduations are related as agreed and waterproof. While is the irrest consists of relativistic and analogue of every quantities. The graduations are related to every quantities. While is the irrest consists of established and are greater over invented, its operation is simple and easily understood. Dismeter 4 lacks. Trice with 10-page Insuration Society, \$1.50. Lastberreits contribute the second of the contribution of the

Masterpieces! Maste craftsmen make and fit Keen Kutter knife parts so exactly they seem grown together. The finished knives reflect this workmanship.

KEEN KUTTER

BARGAIN OFFER

Guaranteed Spinder and Buffer

Thousands are now in use, giving unfailing satisfaction, in shops, garages, hotels and households. Keeps tools and cutlery sharp and silverware burnished.

Its 6 in. abrasive wheel and 7 in. buff do better work and are more convenient to operate than the small wheels usually found on tools of this class.

Motor is ¼ h.p. (tested for 50% overload) 110 volts, 60 cycle, split phase; A. C., totally enclosed and dust proof. Its speed of 1740 r.p.m. gives just the right periphery speed to the large wheels.

A Guaranteed Service Tag, wired to each motor, insures perpetual free consultation service—and a new motor in exchange for the old one should defects develop within 1 year of its purchase. You save \$25.00 about 50% at our price....

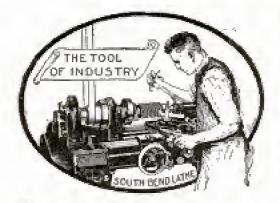

Wire wheel for tire repair work \$1.50 extra.

Motor alone, for running washing machines, ventilating fans, cream separators—all kinds of machines \$13.50

OUR OFFER—Free Opinion as to Patentable Nature

Before disclosing an invention, the inventor should write for our blank form "Record of Invention." This should be signed and witnessed and if returned to us together with model or sketch and description of the invention, we will give our opinion as to its patentable nature.

Our Three Books Mailed FREE to Inventors

TO OBTAIN A PATENT

Contains full instructions regarding Patents, Trade-Marks, Foreign Patents. Our Methods, Terms, and 100 Mechanical Movements illustrated and described; Articles on Patent Practice and Procedure; and Law Points for inventors.

OUR TRADE MARK BOOK

Shows the value and necessity of trade-mark protection and gives informa-tion regarding unfair competition.

OUR FOREIGN PATENT BOOK

We have direct agencies in all the principal foreign countries and secure foreign patents in the shortest possible time and at the lowest cost. Write for our illustrated Guide Book on Foreign Patents, sent free to any address.

LIST OF PATENT BUYERS SENT FREE

Containing unsolicited letters from manufacturers and others who are constantly writing us regarding the purchase or lessing of meritorious patents. We endeavor to assist our clients in the commercial development of their investions.

Specialization—Our Staff
The field of invention is so vast that it is impossible for any one man
to become an expert in all the different classes of invention. For this
reason Victor J. Evans & Co. employ a number of patent lawyers and mechanical
experts who have been rejected for their special knowledge and ability in certain
lines of invention. Each case is placed in charge of experts in the classes to which
the invention relates. the invention relates.

THE VALUE OF YOUR PATENT

will depend much upon the skill and care with which your case is prepared and pressecuted in the United States Patent Office. That every case intrusted to us receives our best efforts, and that our work is done consistently, skillfully, and thoroughly is evidenced by the many unsolded letters of commendation that we receive constantly from our clients. We will jurnish upon request lists of ellents from any State in the Union for whom we have secured patents.

Our New York, Philadelphia, Pittsburgh, Chicago and San Francisco Offices

Owing to the growth of our business we have established for the benefit of our clients Branch Offices in New York City, Philadelphia, Pa., Pittsburgh, Pa., Chicago, Ill., and San Francisco, Cal. These branch offices being located in these large commercial cities together with our Main Office located near the U.S. Patent Office, in Washington, enables us to more promptly handle the business of our clients, particularly as the branch offices are in constant touch with the Main Office and fully equipped to handle patent business in all its branches.

Could anything be fairer?

Easy Terms

While you are using the machine, small monthly payments scattered over a period of more than a year make it easy and convenient to own this full-size, brand-new (unused), 4-row, standard-keyboard type-writer.

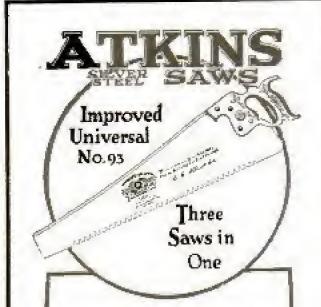

Mechanical Marvel

Strength and simplicity are the automoting qualities of this machine. It embodies the ideas and experience of mechanical geniuses who have been making type-writers for generations. Every essential operating convenience is possessed by Annell', including the 4-row, 42-key, 64-character Universal standard keyboard. It will last a business lifetime and is fully covered by an ironclad guarantee.

Cheaper than coal or wood, cleaner, no work, no dirt, no ashes, soot or smoke. No building of fires, no wood boxes or coal buckets. No shortage of fuel, no high prices and no strikes to worry about. No slaving with hatchets, axes and shovels. No dirt and ashes to make work for you.

MAKES GAS IN ANY

Don't worry with dampers, flues and pokers. Don't interrupt yourself a hundred times a day just to keep the fires going. Don't be satisfied with a heat that is never what you want it. Use INSTANT-GAS

TURN ON THE BEAT AND FORGET IT

Have as much or as little heat as you need, twice as much as coal or wood if necessary. Instant-Gas is started, stopped and regulated with a simple valve. Better cooking and baking because you can have the heat you want. Better heating because it can be controlled. No ups and downs to ruin your cooking and give the family colds. Less work because all you have to do is to keep the reservoir supplied with kerosene. with kerosene.

WHY BURDEN YOURSELF

with coal or wood fires when Instant-Gas is just as economical and sayes all the work? Can be put in any heating or cooking stove in a few minutes at a cost of only a few dollars. No drilling, cutting or other damage to the stove. Gas is made from coal Agents

Our free litera-ture tells how others are making and how you can make tre-mendous profits as agent for the Instant-Gas. Men and women -part time or all time. Write today for agency and sample.

oil or kerosene automatically. All you have to do is to start it — a mere matter of turning a valve, applying a match and then regulating the blaze to the proper heat. From then on you are FREE. The fire will take care of itself. Already giving satisfaction in thousands of homes.

THIRTY DAYS' TRIAL AT OUR RISK

You can try this wonderful burner in your own home without any risk whatever. We are anxious to prove to you at our own risk what a great time, trouble, labor and money saver it is. Write today for our thirty-day trial offer and special low price,

Machine-Shops can now Cash In On Radio

Practical hints in free book tell just how to profit big from nation-wide craze. Big new moneymaking field opened to every live owner of a machine-shop.

Huge Demand for Radio Panels

Every real radio-fan insists today upon one certain material for panelling his outfit; and cutting that material to dimensions is as profitable and practical a job as any machine-shop can ever make money doing. The makers of that material, wanting reputable machine-shops to cash in on this proper preference of radio enthusiasts, have prepared a handy little book which gives the machinist all the particulars he wants to open up for him this immensely profitable new field. A copy is yours for the asking.

Big Money-Maker for Machine-Shops!

This supremely demanded material comes in sheets 38x38 inches, is miles ahead of every other known substance for panelling and insulating radio installations, and can be readily machined by any decently-equipped machine-shop. The difficulty the machinist will have will be in taking care promptly of the orders that will be forced upon him; and that, though it sounds almost too good to be true, is absolutely a FACT. The free book tells all about it, giving every fact the machine-shop man wants to know; and there is not one cent to pay for a copy of it, if you are legitimately a machinist with a plant fit for ordinary work. Send for your copy today, ride the wave of radio development to your own profit, and understand that you commit yourself to nothing whatever by asking for a copy. Ask The Continental Fibre Company, Newark, Delaware.

"ASK ANY RADIO ENGINEER"

"Why the menagerie?"

YOU wouldn't stand for a young menagerie howling around the house. Why permit your radio set to act that way? It's unnecessary. For just five dollars you can add an Acme Audio Frequency Transformer to your set. This ends the howling and distortion so prevalent in the ordinary detector unit and at the same time it greatly increases the volume of incoming sound. Music and the human voice assume their natural tones. No more thin squeaky voices and tiny elfin wails.

You will also want the Aome Radio Frequency Amplifying Transfortage, You can use it with either a vacuum tube or a crystal detector set. It greatly increases the distance over which you can receive benedeasting programs. Just the same price as the Aome Audio Frequency Transformer. Two stages of Aore Audio Frequency Amplification with two stages of Aome Radio Frequency Amplification will give you maximum range, volume and certainly of natural tone. Your set is incomplete without them.

The Acme Apparatus Company (pioneer transformer and hadio engineers and manufacturers) also make detector units, detector and two stage amplifying units, the Acme Clear Speaker, the Atmefone, also C. W. and spark transmitting apparatus. Acme Apparatus is for sale at radio, electrical and department atores. If one is not close at hand, send money direct, Ask also for interesting and instructive book on Transformers. The Acme Apparatus Company, Cambridge, Mass., U. S. A. New York Sales Office, 1270 Broadway.

Now Ready! The DICTOGRAPH Radio Loud Speaker for the Home

THE Radio Public has been waiting for the Dictograph Radio Lond Speaker. Perfected by Dictograph Products Corporation, the ploneer manufacturer of loud-speaking telephones, and world-famous for its cound-transmission instruments; the same supreme quality as other Dictograph products.

Years of experience have made possible this new Lond Speaker—the best in the world—and sold at a price that gives you DICTOGRAPH quality at no extra cost. The great, assured demand has made possible a reduction from the price originally announced. Instead of \$25, it is only \$20—complete with 5 ft. Healthic cord.

See the Dictograph Lond Speaker at your dealer. Dealers can be supplied by local jobbers—or inquire direct.

DICTOGRAPH

Ask for the Dictograph Head Set—the best Head Set in the world, regardless of price. The name Dictograph is your guarantee of su-preme quality. It insures the most sensitive and accurate transmission of sound known to Radio.

The Standard of the World Price Complete with 5 ft. dexible ened

The Dictograph Lond Speaker is heautifully constructed; the cabinet

is of hardwood, chony duished, with dictast black chamed aluminum time arm. The horn is spun copper, highly polished, French lacquered,
non-tarnishable. Completely equipped with 5 ft. flexible silk cord. For any vacuum tube receiving unit. No extra butteries required.

DICTOGRAPH PRODUCTS CORPORATION, 220 West 42nd St., NEW YORK CITY (Branches in All) $\sim\sim\sim\sim$

Over 50,000 HOMCHARGERS in Use

Avoid That rassing Moment!

It takes long experience in "wireless" to insure production of efficient and dependable Radio equipment, SIGNAL stands for that knowledge. SIGNAL—parts or sets—are the product of a plant that has been manufacturing telephone and telegraph equipment for over 30 years—that developed as "wireless" developed—that knows Radio from its very beginning—and whose output of Radio equipment is made by men who have been making that kind of apparatus ever since it was discovered.

Radio, becoming popular almost over night, created an insistent demand far exceeding the supply, and brought onto the market a flood of unreliable, inadequate, and disappointing material.

Avoid that "most embarrassing moment" when something goes wrong just as you expect to entertain your friends, by asking for SIGNAL when you want Radio parts or sets. You'll never be disappointed.

For sale by dealers everywhere, can get it if you insist.

AUDIOTRON AND V. T. CONTROL CABINET

Designed for use with old style supersensitive audiotron as well as modern four prong tube. Potentiometer control of plate voltage for either tube, so bust operating position on their characteristic curves is easily found,

Edison Says "Invention is a Science and should be taught as a Profession"

Une Idea May You a Forting

HOUSANDS of inventions are needed today. Just one little idea can bring you fortune and fame. The world is waiting for new inventions in engineering, chemistry, household articles, radio, and other fields—and - ill pay big m may for even the amplest idea. Lattle things like the tin bottle cap, the crimped hairpin, the rubber on the end of a pencil brought their inventors hundreds of thousands of dollars. Couldn't you make some equally ing.

Couldn't you make some equally simple invention? Haven't you ideas that could be turned into money? Inventing isn't a matter of blind luck—it isn't a question of guesswork. Invention is based on certain principle. ciples, just as any other profession. It follows a definite course of procedure step by step from the origination of the lirst idea to its final develop-

Hitherto, every insenter had to week out these principles of invention for idenself. For every successful inventor knows and uses these principles. He knows WHAT TO INVENT and HOW TO INVENT. But now you can lears in a few months what it took great inventors years of discouragement and terrific struggle to acquire. Fifteen famous inventors have now revealed, for the first time, the secrets of invention. They explain how to originate kleas, how to develop and perfect your ideas, how to develop and perfect your ideas, how to petut your inventions, and how to sell them to your best advantage. In short, they make it amazingly easy for you to become an inventor, simply by learning the whole wonderful science of inventors, step by step, from beginning to end. It requires just fascinating measures of your space time at home.

Course of Its Kind

This is the first course in practical invention that has one been derised. Now you can take Edison's advice and actually learn HOW TO INVENT—how to make invention a profession! In simple, easy-to-understand language, you are told how successful inventors work; you learn how to the the eccrets of invention that convert a simple little idea into money.

Build Health, Strength and Beauty

Have you ever seen a faded, dying plant revive when brought from darkness into sunlight? Have you noted how you can almost see the pale leaves take on new color;—see them cease drooping and turn their face toward the sun;—see the

entire plant resume its former sturdy, vigorous appearance?

Do you know that the human body will reapond just as quickly—just as vigorously—to the stimulation of high-frequency electricity as the plant does to smallight?

Strengthens Entire Body

When the bulb is applied to any part of the body, the strengthening current instantly penetrates to the deepest cells and tissues. There is no shock, no pain, but you feel a warm, reviving stimulation that brings new life to every cell, floods the treated part with warm, fresh blood, and brings a feeling of strength and well being that cannot be described.

Rebuild Your Health

Nature overtomes the weakness or disorder. More than 100 troubles are successfully treated New tissues are built, aches and pains busished, nervousness overcome and the parts treated are developed as they should be.

Our big free book — written in simple language but in a scientific way—tells just what results can be expected in every common disorder. It gives detailed treatment for each ill. Send for your copy today and learn how you can gain buoyant health and a well developed body.

Tobacco Is Hurting You

Look at the facts square in the face, Mr. Tobacco User. You may think tobacco is not hurting you.

That is because you haven't as yet, perhaps, felt the effects of the nicotine poison in YOUR system. For you know that nicotine, as absorbed into the system through smoking and chewing tobacco, is a slow working poison. Slow, yes—but sure.

Tobacco is lowering your efficiency. It slows a man down. Makes it harder for you to concentrate your mind on your work. You haven't near the amount of 'pep' and energy you would have if you stopped using it. There's many a man twice as old as you in years who's twice as young in energy, simply because he lets tobacco alone.

Some day you will realize to what an alarming extent tobacco has undermined your system,

When your hands begin to trembleand your appetite begins to fail— and your heart seems to "skip a beat" now and then and slight exertion makes you short of breath-then you have a right to suspect that TOBACCO is getting the upper hand,

Any well-informed doctor will tell you that these are only a few of many symptoms of tohacco poisoning.

And YOU know that the use of tohacco in any form is an expensive, utterly useless habit. You know you ought to quit.

Cobacco Habit Banished Let Us Help You

It doesn't make a particle of difference whether you've been a user of tobacce for a single month or 50 years, or how much you use, or in what form you use it whether you smoke eigers, eightests, pipe, chew plug or fine cut or use anuff—Tobacco Redeemer will positively remove all craving for tobacco in any form in a very few days. Not the slightest shock to the nervous system. Your tobacco craving will usually begin to decrease after the very first dose—there's no long waiting for results.

Tobacco Redeemer contains no habit-forming drags of any kind and is marvelously quick, ocientific and thoroughly reliable.

It is in no sense a substitute for tobacco. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It helps to quiet the

rectment you have accordingly he desire to use that ca again or to continue the use of the remedy. It helps to quiet the nerves and make you feel better in every way.

Results Guaranteed you. Our legal-binding, money - best guarantee goes with each full treatment. We will refund every cant you pay for the treatment if after taking it according to the may-to-follow directions, it should fail to banish the tubecco habit completely.

SEND Coupon for Let us send you our free boaklet on the deadly effects of tobacco, to-free Proof gether with testimental letters from they have been absolutely freed from the tobacco habit by this simple home treatment. You could not ask for attemper proof that Tehacco Redeemer will free you from the babit than the swidence we will gledly send on request. Just mail the coupon—or a postal will do.

"Yes sir-I'm proud of this Stevens"

SOUNDS a little boastful, perhaps; but still, you know, this Scevens certainly does shoot. You see, the real value of a rifle depends upon its accuracy. And Stevens shines when it comes to accuracy. A Scevens certainly slings a bullet mighty hard and true.

Hold a Stevens barrel up to the light and take a peep through it. Smooth, isn't it? Not a flawthat barrel is accurate. There's a good reason, too.

When a Stevens rifle is drilled, the final cutting cuts away less than one half of a thousandth of an inch. It's slow work-but a Stevens rifle

And Stevens turns out these sturdy, accurate rifles at prices that you can afford. Just look at the prices of the two rifles shown on this page.

Ask at your dealer's or write for the interesting catalog describing our complete line of rifles and shotguns.

The Master-Baldsein "Throatype" Clarophone, complete Described below \$22.50 The Master-Baldwin Head Phone

The new and improved Baldwin Phone. In sufficient for all except code work. One dues the work of two ordinary pisones.

The Baldwin Head-Set \$16.00

The simulard supersensitive head-set for those who want the double phone.

This Amazing Radio Feature

means radio enjoyment for the entire family at a price within the reach of all

YOU who know radio equipment know the Baldwin Phone. You know its war record. The Government commandeered the Buldwin factory during the war to assure Baldwin Head-Sets for War Vessels and Army and Government Stations.

Where exacting work is done there you find

Now this amazing phone is available to the bublic in the Master-Baldwin "Throatype" Charophone, the newest and most perfect speaker.

A Clearspeaker

The Marter-Baldwin is not a so-called 'toud' but rather a clearspeaker, which enables a roomful of people to hear every word or note. hear perfectly every sound, every overtone, even the harmonics. No rasping, buzzing, breaking or any noises save those caused by your receiving set.

-hear clearly and distinctly throughout the average size room any broadcasting that your set will pick up.

No changing of a head-set from one to another. No one misses part of the program.

Now you can really enjoy radio with the Master-Baldwin "Throatype" Clarophone.

Two Secrets of Its Perfection

One secret of this instrument is a marvelous mica disk, unaffected by heat, cold or electric current, which is actuated in both directions by an armature tone-arm superimposed in a magnetic field.

The other is a specially designed speaker, which follows almost exactly the shape of

And its rectangular mouth follows the principle which opera singers know and use to get full resonance from the roof of the mouth.

So the Master-Buldwin "Throatype" Clarophone follows scientifically a perfect model. It gives you the best from your receiving set.

\$22.50 — An Amazing Price

The worderful Charophone costs but \$22.50 complete. So everyone may have oue.

Simplicity of design and large scale production account for this revolutionary price on an instrument which is the highest quality the world affords.

Try It at Our Risk

We make you the judge. Test it 10 days. Attach it to your set. Compare with others. We know you will be delighted. If not pleased, return it to your dealer and get your money back.

Ask your dealer for the Master-Baldwin "Threatype" Clarephone.

If he basn't it order from us, inclosing \$22.50. We'll ship your Charophone immediately, charges prepaid. (Reference: Citizens National Bank, Los Angeles, Calif.) Know the real joys of radio. Get this pecessary equipment.

CLEARED MORE THAN \$1500 THE FIRST YEAR!

THAT'S what Mr. W. O. Hopkins did—selling BUTTER-KIST Popcorn. Many are making much more. Do what he and hundreds of others are doing. Install a BUTTER-KIST Popcorn Machine in unoccupied space in your store. Takes up only a few square feet of space.

The famous BUTTER-KIST Popcorn. Machine manufactures Butter-Kist Popcorn and sells Roasted and Salted Peanuts. Just the treats that appeal to all classes of people.

The BUTTER-KIST Machine makes its own profits. And more—it actually pulls trade. Let the people that come in your store, smell the fresh fragrance of BUTTER-KIST Popcom and they'll buy it. Because people do like popcorn—especially the kind that's made by BUTTER-KIST Machines.

And profits? Out of every dollar's worth you sell you keep 60 to 70 cents! And you can sell many dollars' worth each day. People come back for more. BUTTER-KIST Popcorn actually develops regular customers. They like its delicious taste—its toasty flavor. All this means profits—and profits mean less worry about the rent. Write for the BUTTER-KIST Easy Payment Plan.

New Idea Nets' 10000 Tear

Read What Baker Says:

"Dear Mr. Haywood:
You know when I first talked to you about starting in the reclaimed tire business, I had less than \$500 and was a little cordoubtful about that being enough. 1 certainly want to thank you for orging me to start. I am doing between \$8,000 and \$10,

000 a year with com-petition thicker than flies around a molasses barrel. I have four stations of my own and a half interest in the Rubber Manu-facturers Outlet Co. (Signed) Baker Tire Stores, Ltd., Knighte-tewn, Ind. E. L. Baker".

Here are the pictures of Baker's stations — all busy—all located in small towns—all right in the midst of keen competi-tion. One of Baker's shops was bought by a tire repair man who worked for Baker. This employee saw the money

rolling in, Hadn't money enough of his own to buy the plant. Got financial beight from Friends Baker says his other shops are for asle, it's one way to make money in this pame — establish recializing stations and add at poulit. "I'm out to make money." Baker. "I'm not tied to say locality. Can make more anywhere with your plan reproduces of compacting. I hader has done butting to carroot in. Follow it recipilates — wend that estation from the tiese and get turner particulars.

HIS is Ernest Baker, Knightstown, Ind. Worked as druggist. Money didn't come fast enough. Cast about for something better. Wanted quick action. Saw big possibilities in auto industry. Read my ad. Wrote for particulars. Didn't have much capital. Asked my advice. Acted upon my suggestion. Started out with competition on every side.

New Idea a Winner! Nets \$10,000 Year! Business Grows . Your Opportunity

of conditions. Cashed in on the cheap tire craze. Business grew fast. Competition left away behind, Sold motorists reclaimed, trade-marked tireant sensationally law prices. Made from 200 to 300 per cent on every transaction. Did tremendous business every way-retail—wholesale—by mail—through outlet companies. My new idea did

Adds New Stations Kept on Growing

Baker didn't stop. Was accumulating surplus. Had working capital. Went to another town. Opened station number two. Again the new reclaiming idea went big. Station humaned with activity. Attracted attention. Was nctivity. Attracted attention. Was the talk of the town. Sold reclaimed tires right and left. Gave universal entisfaction. \$50 and \$75 days were common. Other stations were started.

Baker took quick advantage New idea paid big. Baker's earnings now running around \$10,000 a year. Started little more than year ago with less than \$500 Launched out into auto field in midst of fierce competition. New has four stations going full blast. Also has interest in big tire outlet company. What Baker has done you can do.

SLOWING UP? Are YOU sure of the next promotion?

OBACCO is holding back thousands of men. It deadens their mental activities, just a little, maybe, but enough to let the other fellow get the heavy envelope on pay day. It makes your mind sluggish. Your brain slows up a bit. Be frank with YOURSELF! Are you as mentally alert as you used to be? Quit tobacco and see the difference! Give yourself a chance. (If it isn't worth while you can go back to tobacco. But, no man ever does.)

The Keeley treatment is pleasant to take, quick to relieve tobacco fagged nerves and definitely effective. Write us today for the free booklet. It's in a plain envelope. The KEELEY INSTITUTE, Dept. P. M., DWIGHT, ILL.

543 in One Evening I mede 643 just oleht selline Oliver Bargam. N. D. Chelma, Wash.

TO wonder this amazing new invention is bringing fortunes to agents. All over the whole country this new device is doing away with dirty and expensive coal and wood in heating stoves, ranges and furances. Already over \$1,000,000 worth have been sold. You can readily

understand why this new inven-tion—the Oliver Oil-Gas Burner — is sweeping overtheeountry like wildfire. It like wildfire. It does away with all the expense of coal—making every stove a mostern oil-gas burner.

Saves money, time and frudgery. Three times the heat of any other method. No wonder agents are riding in on the tide of big Oliver profits.

It Sells Itself

Agents find it no work at all to sell this nazing invention—the Olives new improved Oil-Gas Burner. They just show emaring inventual-proved Oil Gas Burner. proved Oil-Gas Burner. They just show it—taking only one minute to connect it—then light it. And the sale is made! This new invention is its own salesman. It sells itself! The Oliver Oil-Gas Burner is the most timely thing that could be put out. It dispenses entirely with coul and wood when all signs indicate that coal will be impossible to get this winter in every section. It burns the cheapest fuel—oil. It saves a woman work new in times when she is looking for just such things. Just as much or as little heat as wanted, off and on instantly by simply turning a valve. on instantly by simply turning a valve.

The Secret of Big Money

Of course, now that you know the facts you yourself can understand why this

new invention is going over like wildfire! and you can understand why F. W. Bontley made \$215 in one day. Why J. Cornegey mode \$1,000 in one month and why handrods of other agents are clean-ing up big too.

These men know the secret of big money. They know a good thing when they see it and they know that the time is ripe for this new Oliver improved Oil-Gas Barner. They know that this age of high-priced coal and word and the present serious coal famine makes it necessary for some substitute. They see ships and locomotives being run by oil and big buildings being heated by it. And they know that an invention that

invention that makes use of this cheap fuel for every home and yet does it on as to give coal or woodis the thing they want to tie

Wood

Big Profits Quickly Made

You too can use this secret of big money, You do not need to be a high-powered salesman. The 'dilver's amazing features sell it for you. When people see is they know at once that it is the thing they want. You will realize that this is a proposition that will pay you as hig money as it does others. We have a definite number of open territories which we are ready to dispose of to those who act quickly. Every these at least of this work with his money pose of to those who act quickly. Every territory allotted is filled with big-money opportunities. And this big money comes easily. Because not only does this inven-tion practically sell itself on eight but when you have sold one this one will sell several you have sold one this one will sell several others as soon as your eigstener's friends and neighbors see it. And thru our special plan you get crodit and commissions for every sale in your territory.

You can also make big money just by using your spare time. Note how N.' B. Chelan made \$43 in one evening.

Coupon Brings

If you want to make at least \$5,000 a year ensity, mail this coupen now for our offer. We are not making any extravagant claims about this. We do not have to. We believe that your common sense will indicate a good proposition to you when you know about it. We want to give you the facts. Won't you write us? And by doing so quickly you will be allotted an exclusive territory with private selling rights.

The coupen will bring you the facts and will save you writing a letter. But mail the coupen at once.

Hu Addren

My Name.

My Address,

This book explains how inexpensive soft woods may be finished so they are as heautiful and artistic as hard wood. Tells what materials to use and how to use them. Includes color charts—gives covering capacities, etc. It is the work of experts—beautifully illustrated in color. Fill out and mail coupon for a free copy.

Make Inexpensive Soft Wood Furniture Look Like Hard Wood

WITH Johnson's Wood Dye inexpensive soft wood such as pine, cypress, fir, etc., may be finished so it is as beautiful and artistic as hardwood. Johnson's Wood Dye is very easy to apply—it penetrates deeply, bringing out the beauty of the grain without raising it—dries in four hours—and does not rub off or smudge. Made in fourteen popular shades, all of which can be easily lightened or darkened—full directions on every label.

JOHNSON'S WOOD DYE

Johnson's Wood Dye has many uses, for both the artisan and amateur. Architects and contractors specify it for coloring woodwork and flooring in new buildings. Painters and decorators use it with equal satisfaction on new and old woodwork of all kinds. Householders delight in it for doing over old furniture and for coloring reed and wicker baskets, etc. Manual training teachers and pupils use it for finishing their models. Upholsterers, furniture repairers and cabinet makers find it "just the thing" for their work—old and new.

USE THE COUPON FOR FREE 5-DAY TRIAL!

Our Latest and Finest Model

peedster

The Result of 27 Years of Experience

Use It 5 Days Before Deciding

Then buy it, \$4 after trial, and \$4 a month. Or return it at our expense

You cannot gain any conception of the superiority of the new OLIVER Speedster Model, our latest and greatest creation, unless you test it yourself. You will be amazed at the ease with which you can operate it. You'll be delighted at its quiet action. You'll be astonished at the countless improvements and refinements it offers. The many automatic labor-saving devices.

So we offer to send you the OLIVER Speed-ster on FREE 5-DAY TRIAL so that you may test it in your own home, or office, and find out for yourself why it is called the SPEEDSTER. Expert operators tell us that with it they can increase their output by a third. They praise its freedom from nerve strain, its velvet soft touch. They tell us that it is the ultimate in typewriter efficiency.

Use It — Compare It!

Printed claims may not convince you. We say, frankly, that if we said all the wonderful things about the OLIVER Speedster that we feel justified in saying, you might accuse us of exaggeration. So we say to you - TEST IT. Use it in any way you see fit. Compare it with any standard typewriter.

Over One Million Sold

The new Speedster Model OLIVER was presented as our millionth typewriter. It is our newest, most improved, most refined model. It has all the splendid mechanical advantages which have made the OLIVER famous. It is the climax of our 27 years of manufacturing.

In this time a million OLIVERS have been sold to individuals and to great corporations like the N. Y. Central Lines, the N. Y. Edison Co., the U.S. Steel Corporation, Morris & Co., and other giant concerns. They bought the OLIVER after severe tests and comparisons.

New Low Price Offer

We offer you this greater OLIVER - Speedster Model-for \$35 less than the \$100 price of other standard machines. Our price of \$65 is the factory price, with the expensive and wasteful sales costs eliminated. And we offer you this startling new typewriter on easy terms.

Send No Money—Easy Terms

Buy it only after trial. We send it to you without one cent down. You test it. It is built to give a lifetime of service. Note its symmetrical beauty and compactness. Note its rich enameled black and gold finish. Then test its quiet, easy, efficient operation.

If the OLIVER doesn't convince you, after 5.Day Trial, that it is the best standard typewriter at any price, return it at our expense, the trial will not have cost you anything.

Fill Out and Mail Coupon

Asking for a free trial incurs no obligation to buy. The coupon will bring you an OLIVER Speedster, new from the factory, on FREE TRIAL. If you want more information before ordering an OLIVER sent on FREE TRIAL, check the coupon accordingly.
